LAW ENFORCEMENT BULLETIN

A complaint was filed before the United States Commissioner at Cleveland, Ohio, October 13, 1936, charging Brady and others with the interstate transportation from Lima, Ohio, to Chicago, Illinois, on April 27, 1936, of jewelry valued at \$12,000.00 knowing it was stolen, in violation of the National Stolen Property Act.

United States Department of Justice**

John Edgar Hoover, Director

Washington, D. C.

VOL. 5 NO. 12

DECEMBER 1, 1936

The Federal Bureau of Investigation, U. S. Department of Justice, is charged with the duty of investigating violations of the laws of the United States and collecting evidence in cases in which the United States is or may be a party in interest.

The following list indicates some of the major violations over which the Bureau has investigative jurisdiction:-

National Motor Vehicle Theft Act
Interstate transportation of stolen property valued at \$5,000 or more
National Bankruptcy Act
Interstate flight to avoid prosecution or testifying in certain cases
White Slave Traffic Act
Impersonation of Government Officials
Larceny of Goods in Interstate Commerce
Killing or Assaulting Federal Officer
Cases involving transportation in interstate or foreign commerce of any persons who have been kidnaped
Extortion cases in which interstate commerce or interstate communication is an element
Theft, Embezzlement or Illegal Possession of Government Property
Antitrust Laws
Robbery of National Banks and Member Banks of Federal Reserve System
National Bank and Federal Reserve Act Violations, such as embezzlement, abstraction or misapplication of funds
Crimes on any kind of Government reservation, including Indian Reservations or in any Government building or other Government property
Neutrality violations, including the shipment of arms to friendly nations
Frauds against the Government
Crimes in connection with Federal Penal and Correctional Institutions
Perjury, embezzlement, or bribery in connection with Federal Statutes or officials
Crimes on the high seas
Federal Anti-Racketeering Statute
The location of persons who are fugitives from justice by reason of violations of the Federal Laws over which the Bureau has jurisdiction, of escaped Federal prisoners, and parole and probation violators.

The Bureau does not have investigative jurisdiction over the violations of Counterfeiting, Narcotic, Customs, Immigration, or Postal Laws.

Law enforcement officials possessing information concerning violations over which the Bureau has investigative jurisdiction are requested to promptly forward the same to the Special Agent in Charge of the nearest field office of the Federal Bureau of Investigation, U. S. Department of Justice. The address of each field office of this Bureau appears on the inside back cover of this bulletin. Government Rate Collect telegrams or telephone calls will be accepted if information indicates that immediate action is necessary.

The FBI LAW ENFORCEMENT BULLETIN is published by the Federal Bureau of Investigation, United States Department of Justice each month. Its material is compiled for the assistance of all Law Enforcement Officials and is a current catalogue of continuous reference for the Law Enforcement Officers of the Nation.

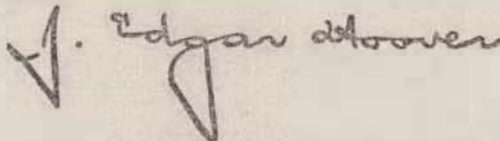

John Edgar Hoover, Director
Federal Bureau of Investigation
United States Department of Justice
Washington, D. C.

It is my pleasure to announce in this issue of the FBI Law Enforcement Bulletin that the International Association for Identification at its recent Convention accepted the invitation tendered by the Federal Bureau of Investigation to hold its next annual Convention in Washington, D. C.

For some time I had looked forward to the opportunity of inviting the members of this splendid organization to hold an annual Convention in Washington. Consequently, I am afforded a great deal of pleasure in the publication of the acceptance of the Bureau's invitation herein. More detailed plans concerning the outstanding features of the Convention will be published from time to time. In particular, careful consideration will be given to the most advantageous and convenient dates for the conduct of the Convention and the dates will be published as soon as possible in order that the members of the Association can arrange their personal affairs to attend this gathering.

It is my sincere hope that the Bureau will be afforded the pleasure of entertaining the entire membership of this international group of identification experts at its 23rd annual Convention at Washington, D. C., in 1937.

Since this is the last issue of the FBI Law Enforcement Bulletin before the Holiday Season, I wish to take this opportunity of wishing each of you a very Merry Christmas and a Happy New Year.

A handwritten signature in dark ink, reading "J. Edgar Hoover". The signature is written in a cursive style, with the first letter "J" being particularly large and stylized.

Director.

THE FBI NATIONAL POLICE ACADEMY

Eighty-one representatives of local, county, and state law enforcement agencies have graduated from the three sessions of the FBI National Police Academy which have been held to date. These eighty-one graduates represent eighty-one law enforcement organizations located in thirty-nine states and one territorial possession of the United States. Each of these graduates is prepared to initiate or assist in a school of instruction in order that the benefits of his training and experience may be imparted to the other members of the organization which he represents. It is significant to note that there are 52,895 law enforcement officers enrolled in the departments which have been represented in this school, and these law enforcement organizations are bound together in a close chain of cooperation through the organization of the graduates known as the "FBI National Police Academy Associates." As a result of this organization, there has been created a nucleus of friendly associates and acquaintances which is calculated to be of tremendous benefit to each of the agencies which have designated a representative to take this course of training.

During the year 1937, it is planned to conduct three additional sessions of this school, which will begin in January, May, and September of the coming year. In order that the greatest amount of personal benefit may be received from the training in the Academy, it is necessary to limit the number in attendance at each school to thirty-five representatives of local, county, and state law enforcement organizations. The only requirement for admission is a letter forwarded by the head of the organization, advising that it is desired to designate a representative to take this course of training. The representative must be in good physical condition and less than forty-six years of age. He should be the employee of the department who is best qualified to take the training and subsequently impart the benefits of his training to the other members of the organization which he represents. This Bureau will then assist this employee, if it is desired, in operating his own training school.

A letter from the Chief. Superintendent, Commissioner, or other executive official of your department will receive the personal attention of the Director of the Federal Bureau of Investigation as an application for a representative to attend one of the twelve-week sessions of the FBI National Police Academy.

AUTHENTIC FBI MOTION PICTURE

A short feature motion picture entitled "You Can't Get Away With It," produced by the Universal Pictures Corporation, will be released throughout the country on November 30, 1936. This picture, directed by Mr. Charles E. Ford, contains the first authentic portrayal of the factual methods of operation of the Federal Bureau of Investigation and includes views depicting certain phases of the scientific crime detection work of the Bureau, as well as the training afforded by the Bureau to law-enforcement officials of the United States in the FBI National Police Academy.

THE REPRODUCTION OF ORIGINAL EVIDENCE IN THE THIRD DIMENSION

Continued from November 1936 Issue FBI Law
Enforcement Bulletin

FOOTPRINTS (11)

Footprints, though long known as an invaluable means of identification to the investigating officer are still commonly overlooked or completely forgotten by the overzealous or inexperienced officer on first arriving at the scene of the crime. By the time an experienced investigator who realizes the value of footprints has arrived, he often finds, to his dismay, that either the previous officer or curious individuals attracted there have trampled the surrounding terrain to such an extent that it is impossible to ascertain whether the perpetrator of the crime has left this important clue to his identity.

An instance of the value of such casts to the investigator is to be seen in a recent Bureau case. Several footprints were found near a box car which had been broken into and emptied of its cargo. The location of the footprints indicated that the thieves had probably loaded the goods into a truck. In addition to these prints, a tire tread pattern was found clearly impressed in the ground in the immediate vicinity of the box car. Casts were made of the footprints and the tire track and sent to the Technical Laboratory for examination. The tire tread cast was checked against the reference collection (12) of over 1800 blueprints of tire patterns covering all of the tire models manufactured in this country and Canada and was identified as being made by a Goodyear heavy duty all weather balloon tire. During the ensuing investigation of the crime, a suspect was taken into custody. His right shoe was found to have the same dimension as one of the reproduced footprints discovered near the box car. Irregularities in the wear of the heel were found in several of the casts. To further substantiate the suspect's complicity in the crime, the tire tread imprint matched perfectly the tire on a truck belonging to this person. The expert's finding as to the make of tire causing the imprint was confirmed. The damaging evidence amassed against the defendant will undoubtedly be of material assist-

-
- (11) The discussion of a method for reproducing footprints on such surfaces as stone, wood, concrete, and linoleum, is obviously excluded in a discussion pertaining to reproduction of evidence in the third dimension. However, for an interesting discussion on the methods of obtaining a facsimile of such a print, see A. Lucas, "Forensic Chemistry and Scientific Criminal Investigation" (3rd Edition, 1935), page 188. See also "Reproduction of Impressions," The Journal of Criminal Law and Criminology, July, 1935.
- (12) For a more comprehensive discussion of the reference collection of tire tread patterns maintained in the Bureau's Technical Laboratory see, "Tire Tracks - FBI Reference Collection," FBI Law Enforcement Bulletin, January, 1936.

ance in the prosecution of this case. (13)

Assuming that an imprint has been found at or near the scene, the next important problem to consider is that of preserving or reproducing it. To attempt to preserve the footprint in its original state is a difficult and rather impractical task. Then too an immovable object far away from the court room has very little probative value. An alternative would be to actually remove that portion of the soil in which the imprint is situated, a difficult procedure and one generally resulting in partial or complete destruction of the evidence. (14) A safer method of handling such a clue is to make a replica of the print. In any event, it is extremely desirable, if photographic equipment is available, to first secure a clear photograph of the print before attempting a reproduction by other methods. (Figure 1 page 5)

A footprint in moist compact earth can be reproduced with little difficulty. Any debris or particles of dirt that may have fallen into the impression should first be carefully removed. Then, if plaster of Paris is to be employed, pour it gently, so as not to deform the impression, which is now being used as a mold. The plaster is first introduced into the impression where there generally is no mark of importance and allowed to gradually fill the depression. If additional precautions are deemed necessary, the fall of the plaster can be broken by a piece of cardboard or wood held immediately over the footprint from which it will drip into the mold. (See Figure 2 page 5) After the plaster of Paris has covered the footprint to about one-half inch in depth, a skeleton structure of sticks or, if available, a piece of mesh wire should be placed upon the plaster to give the cast increased strength and rigidity. (See Figure 3 page 6) (15) Thereafter the remainder of the material can be poured until the cast is at least an inch thick. To prevent the plaster from spreading, a wooden or cardboard rectangular wall about one inch in height can be placed around the print. The cast should be allowed to set for about fifteen minutes, after which time it is generally sufficiently rigid to remove. (For finished cast see Figure 4 page 6) A simple test to determine whether the plaster has hardened is to place your hand on it. If the plaster is no longer warm,

-
- (13) For another instance where a footprint was instrumental in the solution of a case, see "Spring 3100," April, 1936, page 22.
 - (14) Dr. Hans Gross (Supra Footnote 2) p. 359, discusses Hadann's method of actually removing the print from the earth, and concludes that it is rather a perilous procedure.
 - (15) A plaster cast, without reinforcement, is quite fragile after it has first been removed from the imprint and requires careful handling. However, after it has been allowed to dry for about 24 hours it becomes sufficiently solid to enable average usage. The safest procedure and that recommended by the Technical Laboratory is as suggested above. However, Hans Gross suggests that by applying silicic acid to the plaster cast it will become as hard as stone. For additional suggestions on hardening the cast, see Soderman and O'Connell, "Modern Criminal Investigation," page 440.

Figure 1

Figure 2

Figure 3

Figure 4

it is ready to be removed. Dirt adhering to the cast usually can be washed off with water.

Additional precautions must be taken with imprints found in sand, loose dry dirt, or dust. Here it must first be coated with a hardening solution which will cause the soil particles to adhere sufficiently to prevent destruction of the print when the casting material is poured. A fast drying shellac will serve the purpose. Before applying the dust fixative, it is best to first place a box or cardboard carton, from which the bottom has been removed, over the print. This will serve to protect the print from any sudden gusts of wind or other factors that might cause damage. The solution can then be placed in a spray gun and directed at the side of the protective covering at a point about one and one-half feet above the print, permitting a fine spray of the shellac to settle gently into the mold. (See Figure 5 below)

Figure 5

After a fine film has covered the print it should be allowed to dry. Sometimes it is advisable to apply a second or even a third coat of the fixative before actually pouring the reproductive mixture into the mold. Care should be exercised to see that nail holes or other small identifying depressions are not filled up during this hardening process.

Should the identification officer desire to preserve the original imprint intact on removal of the cast, a fine layer of oil (linseed or light machine oil will suffice) should be sprayed onto the shellacked surface after it has hardened. This additional precaution will further serve to prevent an adherence of soil particles to the cast and likewise will alleviate the danger of injury to the imprint.

Footprints found in snow have been successfully reproduced in the Technical Laboratory of the FBI in the following manner: The print is first covered with a layer of talcum powder. A fine wire screen can be used to advantage in sifting the powder on to the print and will insure its even distribution. Though some authorities (16) advise the addition of a layer of fixative followed by an additional layer of talcum powder as preparatory measures, successful results have been achieved in the Laboratory when only one coat of talcum powder has been used. The talcum powder serves as an insulator between the snow and the plaster, preventing the heat created by the hardening plaster from melting the snow before the desired reproduction has been secured.

So far mention has been made only of plaster of Paris as a medium of reproduction due to the fact that this material is most conveniently used in this type of reproduction. From a practical standpoint all that is essential is the plaster, a pail, and some water and a minimum of previous experience in its preparation. Further, plaster of Paris can generally be purchased at the nearest drug or hardware store. In addition to plaster of Paris, however, moulage and other plastic substances previously mentioned in this article may be used for the preparation of footprint casts.

The essential fact to be borne in mind is that the print impressed in the earth is created by a shoe or foot coming in contact therewith and hence the imprint may be considered the negative or concave facsimile of the creating object. By pouring plaster of Paris into this mold and allowing it to harden, a positive reproduction of the details of the negative is obtained. Hence the final product is a faithful replica of the sole of the shoe which can readily be compared with other shoes. Another medium of comparison that has been suggested, (17) is to require the suspect to make an imprint with the shoe in question in earth similar to that in which the evidence print was found. Then from this negative mold strike a positive cast. The known positive and the questioned positive have now been created under similar conditions, and being of like composition may be more effectively and accurately compared. On the other hand if the imprint is the evidence to be reproduced, the reproduction of the object creating the imprint would be considered the negative impression from which to cast the positive imprint. Many investigators prefer to reproduce the imprint

(16) See Soderman and ●Connell (supra note 15) for their discussion on the reproduction of footprints in snow in the chapter entitled "Footprints."

(17) Dr. Walter Sobolewski, "A Contribution to the Technique of Footprint Casts," *Przelad Policyjny*, May, 1936.

itself because it is then possible to effectively illustrate the fact that the suspect's shoe fits into the imprint.

TIRE TRACKS

Tire tracks sometimes afford the investigator a definite clue to the identity of the automobile used by the criminal to effect his escape from the scene of the crime. They should be looked for not only at the scene of the crime but along the established course of travel both to and from the place in question. Wherever found, immediate steps should be taken to effect their preservation, not only by photography, if such equipment is available, but by casts as well. Though the uninitiated may think that such a clue is at best a vague, intangible means of ascertaining the identity of the criminal, there are numerous instances wherein such evidence has proved to be the deciding factor in the final solution of the case. Recently a member of the first FBI National Police Academy had an opportunity to effectively utilize his recently gained information on tire tracks shortly after his graduation. In a "hit-and-run" case a boy was killed by a reckless driver who fled from the scene. During the course of a careful examination the officer discovered a tire track, apparently made by the death car, and using his recently acquired technique, he made a reproduction of the entire track. Shortly thereafter, as a result of intensive investigation, an automobile was located which, by virtue of a comparison of one of the tires with the cast made at the scene of the crime and also a comparison of glass found near the tire track, was definitely identified as the car sought. Having established the identity of the car, it was a relatively simple matter to locate the owner who on being confronted with the damaging evidence amassed by the investigator, confessed.

Another instance of the value of such casts to the investigator is to be seen in a recent Bureau case involving Sidney Green, James Scarborough, and Jason L. Hunter, charged with a theft of Government property committed at the Langley Flying Field. An automobile tire track was observed in the soft ground near where copper wire cable had been stolen on the reservation. A plaster of Paris cast was made of this impression showing the design detail of the tire. Information was subsequently obtained that two Negroes in an old model car had sold similar wire to a junk yard. Inquiry upon the description of one of the Negroes resulted in causing a search for Sidney Green, then regarded only as a possible suspect. Green when finally located was driving an old automobile which, upon inspection, was found to have a tire identical in design with that of the casting. Chips of copper wire were found on the floor of the car and the defendants subsequently confessed the theft.

The problem of reproducing a tire tread is not unlike that of casting a footprint. (18) In fact, the same procedure of first preparing the mold and then pouring the material is recommended.

(18) For information on the reproduction of tire tracks found on paving or other hard surfaces, see Footnote 11, supra.

TOOL MARKS AND PERISHABLES

The once perplexing problem of how to remove to the police laboratory for examination purposes a door, window sill, safe, or similar object that has impressed in it the identity of the burglar's tool used to effect a forcible entry has been circumvented by the simple and effective process of reproducing the telltale marks in moulage and transporting the cast wherever desired. These marks can often be reproduced with such fidelity that the original tool when found will fit perfectly into the cast. Even the minute striations caused by slight imperfections existing in the cutting edges of the tool can be reproduced through careful casting methods.

In securing a replica of such markings it is generally unnecessary to treat the surface before pouring the material. However, should the surface be a soft porous wood, it may be treated with a solution of paraffin and benzol. The benzol evaporates and leaves a thin coating of paraffin thereby preventing adherence of the reproductive material. Because of its non-adherent quality, moulage is very successfully used in this kind of casting.

It is generally advisable to place a supporting structure around the impression before pouring the moulage particularly if it is in a perpendicular plane. This wall which can be made from regular modeling clay to a height of about one inch will serve to keep the moulage from spreading. The negative material may now be poured onto the imprint until it reaches the top of the retaining wall. These tracings generally cover a small area and therefore it is seldom necessary to add reinforcing material to the negative mold. However, if the investigator desires to reinforce the mold, he may do so by adding short lengths of single strand wires or a mesh wire after about one-half of the material has been poured. Extreme care should be exercised in removing the mold from the tracings so as to prevent injury to the minute identifying details. As the negative material tends to shrink slightly on becoming dry, the positive wax should be applied soon after the negative mold is completed. Reinforcements may be added to the cast in the manner outlined above.

Axes, knives, scissors, screw drivers, in fact all instruments employed as cutting tools leave markings which can often be identified with the tool responsible for their existence. Of course, if the tool mark is impressed in a small object which may easily be transported and will not deteriorate with age, there is no real purpose served in reproducing these markings. Certainly the original is better from the standpoint of a microscopic study of the markings with the suspected tool and its subsequent use in court.

Perishable objects present an acute problem to the investigating officer. Immediate action must be taken to preserve any marks of identity left on an object of this nature. For example, tooth impressions left in an apple core found at the scene of a crime may constitute a clue to the identity of the individual who has eaten the apple.

To make a cast of an apple core, the investigator should take a piece of flexible cardboard and roll it into a cylindrical shape large enough to allow at least one-half an inch clearance around the circumference of the core when placed in the cylinder in an upright position. The sides of the cylinder can be fastened together with a strip of adhesive tape. One of the open ends of the cylinder should be placed on a smooth plane surface so as to prevent the negative moulage from escaping from the bottom of the enclosure. Although a glass or metal container may be employed instead of the cardboard cylinder, the investigator will have considerable difficulty in removing the mold due to the vacuum created in the bottom of the glass when an attempt is made to remove the negative material. As will be subsequently explained, it is necessary to remove the mold from the container in order to extract the apple core. Having taken the steps necessary to prevent the loss through leakage of the negative material, it should be poured into the container until the bottom is covered to a depth of about one inch. Then insert the apple core at once, being certain that the core does not sink to the bottom of the receptacle. At this point, it is perhaps well to remind the investigator that the negative material when poured must not be too hot, otherwise he will find himself in possession of a baked apple core from which all identifying marks have been eradicated. The desired temperature for the negative material is from 120° to 140° F.

After the core is inserted, moulage should be added until the core is entirely covered and the mold should then be permitted to completely congeal. The mold thus produced should be removed from the container, which is readily accomplished by merely removing the strip of adhesive tape holding the cardboard together and then peeling the cardboard away. After removal from the container the mold should be carefully cut into halves, to permit the apple core to be removed. An alternative method, which eliminates cutting the mold, is to prepare it in two sections by pouring the second half after the first half of the mold has congealed. The two portions will then readily separate, permitting removal of the core. In this case, of course, the core should be placed in a horizontal rather than vertical position, to eliminate "undercuts."

After the core has been carefully removed the two sections of the mold should then be securely fastened together, so that the positive moulage will not leak out. To permit pouring of the positive material, a hole must be made in the top of the mold. The best place to make this hole is in that section of the mold which has reproduced the stem of the apple. The cast when finished may then be repaired at that point without injury to the portion containing the identifying marks. If proper precautions have been taken, the investigator will have a perfect reproduction of the tooth impressions found on the original evidence. He is now armed with a permanent clue to the identity of the criminal and no matter how long thereafter it may be before the criminal's apprehension is effected, the evidences of his presence at the scene of the crime are still in a perfect state of preservation.

If plaster of Paris is to be used in making the reproduction, the apple core must first be treated with a very light coating of either

vaseline or a light oil, preferably linseed oil. This treatment is necessary to prevent the plaster of Paris from sticking to the apple core. The mold should be made in two sections and provision should be made for accurately aligning the top and bottom halves. It is also essential that the investigator place a light film of oil on top of the first section of the mold before adding the remainder of the plaster. If this is not done the two sections of the mold will "freeze" together, thus necessitating a destruction of the mold to remove the apple core. Similarly before pouring plaster into the mold for the purpose of obtaining a positive cast, it is necessary to first thoroughly grease the inside of the mold to prevent adherence of the positive to the mold.

POST MORTEM RECONSTRUCTION

Referring back to that part of the hypothetical problem presented in the introduction to this discussion which left the investigator faced with the problem of identifying a murdered victim, let us consider in greater detail the solution to the problem. Suppose that decomposition has set in and there are ugly wounds about the face and head, as is often the case. A photograph will not be recognized by acquaintances because of the vast change caused by the disfiguring wounds. A moulage reproduction of the disfigured features, however, may in many instances, be reconstructed into a life-like representation of the normal features. (19) Further, by painting the moulage cast to simulate normal living flesh it is possible to secure a highly realistic replica of the face of the victim. Even where the features have not been distorted, moulage is the more successful method of perpetuating the evidence because of the added presence of depth which is, of course, lacking in a photograph. It is not suggested that the photograph be eliminated; on the contrary it is believed essential that complete

-
- (19) See E. Febscher, "The Poller Moulage Method," Police "13-13," Chicago Police Journal, May, 1934. The Author, in discussing the reconstruction of facial features that have been marred by wounds, cites the following case: "Interesting also is the manner of identification in the case of Katherina Schaftner-Fellner who was found murdered in the Lainzer Zoological garden in 1928. In order to cover all traces of his crime, the murderer poured benzine over his victim and set it afire. A rain which set in put the fire out, but the parts about the jaw bones were already greatly damaged. The cheeks were badly charred and perfectly stiff. It was not possible to close the mouth. All essential clues for ascertaining the perpetrator of the crime or identifying his victim were lacking. The casting department of the Vienna police took an impression of the upper and lower teeth and made a mask of the face. This mask was kept unchanged as it was taken from the body, but using it as a model another mask was now constructed to illustrate what it was supposed the victim might have looked in life. A photograph of this second mask showing no scars or wounds was then made. After a year's time, the victim was identified through the cast which had been made of her teeth and through the mask."

photographs be taken whenever possible. However, it is also believed highly important that photographs be supplemented by tri-dimensional reproductions to the fullest possible extent. (20) Numerous articles written on the subject cite actual instances where identification has been effected through the medium of moulage death masks. (21)

For the benefit of the reader who has not had previous experience in making face masks, the procedure followed in the Technical Laboratory is being set forth. Preparation of the face before the casting material is applied plays an important part in the success of a good reproduction. Of course, when working with fresh cadavers no preparation is necessary other than the removal of fresh blood or moisture, it being kept in mind at all times that the features must be reasonably dry before the negative material is applied. Bodies that have been retained in a refrigerator should be allowed to stand at room temperature for a reasonable period of time to eliminate condensation of moisture during the making of the mask. Cadavers removed from water, snow or such materials should be dried before reproduction of features is attempted. This drying can be done with absorbent cotton by simply sponging the features. Decomposed features should be sponged dry with absorbent cotton, then sponged with alcohol to harden the tissues, followed by sponging again with dry absorbent cotton.

In addition to the plastic materials necessary for making these masks the operator should have at least two strong brushes, about one-half or three-quarters of an inch across the bristles of the brush, a large spatula and a pocket knife for trimming the material as it hardens.

In getting the subject ready for reproduction of the features, the nasal cavities should be plugged with cotton, care being taken not to distort the contour of the features. The oral cavity also may be plugged or filled with cotton and the mouth closed. A hole is then made in the center of a piece of heavy cardboard and the cardboard adjusted so that the features to be reproduced will show through, cutting off the mask at the hairline just in front of the ears and under the chin. (See Figure 6 page 15) It is not believed necessary, when making death masks, to reproduce the ears because they do not ordinarily serve as a means of identification and when cast as a portion of the total death mask the technique is a little more involved. The cardboard can be held in place by using two-inch adhesive tape, fastening it around the bottom of the mask.

-
- (20) For a discussion of the superiority of third dimensional reproduction over photography see H. P. Wunderling, *Posmoulage For Identification*, the National Police Officer, May 1934; *Moulage Experiments*, the National Police Officer, September 1935.
 - (21) See article entitled "Moulage," FBI Law Enforcement Bulletin, September 1, 1935; George A. Weber, "Moulage--When and How to Use It," California State Division International Association for Identification, (Twentieth Annual Convention, Stockton, California, May 27-29, 1935); E. Febscher, the Poller Moulage Method, Police "13-13," Chicago Police Journal, May 1934.

The first application of the negative material requires the use of the brush. It should be brushed into all the crevices rapidly but carefully so as to smooth out any air pockets next to the skin. (See Figure 7 page 15). After the features have been uniformly covered with about one-half inch of the material, reinforcements may be added. Strips of gauze saturated with negative moulage or a piece of mesh wire bent to conform with the contour of the mask serve as adequate strengthening media. Additional material is now added until the mold has a uniform thickness of from one to one and a half inches. At no time during the making of the mold should one layer be allowed to set before additional material is added. Otherwise the layers are apt to separate when removing the mold, leaving it greatly impaired. The mold generally requires about thirty minutes to set. Setting may be hastened by the application of cold cloths or by an electric fan. Premature removal of the mold results in a breaking away of the inner portions, thereby ruining the reproduction.

Before removing the mold, it is advisable to cut away the cardboard so that the operator will have an edge by which to seize the mask with his finger tips. Of course, all negative moulage that has run on to the cardboard should first be separated with a spatula. The mold may now be carefully worked loose around the forehead and gradually around the edges, allowing air to pass under it. Then lift from the forehead and slide downward towards the chin so as to allow the "undercut" of the chin to free itself. Despite all possible precautions, the operator will often discover defects in the mold. If such defects are convex he should carefully cut them off so as to avoid concave defects in the cast. On the other hand, concave defects in the mold are best left untouched as the resulting convex defects in the cast are more readily corrected than are concavities.

The cast or reproduction should be made as soon after the completion of the mold as possible, otherwise the mold will dry and shrink thereby contorting the features. The mold should first be placed on a foundation which supports the entire outer surface, which may be accomplished by setting the mold into a box filled with dirt or sand. The operator can then fill the mold about one-third full with the positive moulage. With a brush, he then swiftly works the material into all parts of the mold, being certain that the edges of the mold are covered. If the first layer of the positive material, which hardens quite rapidly, thoroughly covers the inside and edges of the mold, the danger of overlapping is avoided. Overlapping is caused by the junction of hot and cold positive moulage which in failing to flow together leaves lines on the finished mask. After a shell about $\frac{1}{4}$ " thick has been made, paraffin or some other suitable filler can be used to build up the remainder of the cast. The cast when completely hardened can be removed in much the same manner that the mold was removed from the face. (See Figure 8 page 16)

The reconstruction of distorted features caused either by defects or wounds is best accomplished as soon as the cast has been removed. The positive moulage is still in a slightly plastic state and can be more readily worked on than after it has completely hardened. Thereafter the mask can be painted so as to give it a lifelike appearance.

Figure 6

Figure 7

Figure 8

So far only the facial features have been mentioned. Tri-dimensional reproductions of other portions of the body, such as the hands, are often a valuable aid in an investigation. Consider, for example, the case related in a recent article entitled, "The Poller Moulage Method," (22) quoted as follows: "In Pressburg, two hands were washed up on the banks of the Danube. It was supposed that the murdered person might be a certain woman who had been expelled from Vienna on account of fraud. Police officers were sent from Vienna to investigate. The hands were, however, so lacerated that it was not possible to take fingerprints. Casts were therefore made and by counting the papillary ridges which were distinctly visible on the reproduction it was ascertained at once in identification bureau of the Vienna police that the supposition was false. Further investigation in this direction could, therefore, be dropped."

The manner in which the friction ridges on the fingers can be reproduced and built up is best illustrated by a recent case in the FBI Technical Laboratory in which the hands of an unidentified man were sent in

(22) See E. Febscher, The Poller Moulage Method (Supra Footnote 21) page 22.

for printing and searching through the Bureau's fingerprint files.

As the skin on the fingers was very leathery and wrinkled, it was extremely difficult to obtain legible prints. In an effort to correct this difficulty, the hands were first treated in a caustic soda solution to soften the skin and then glycerin was injected under the skin in an effort to round out the bulbs of the fingers. As these experiments were not entirely successful, negative moulage molds were made of all of the fingers. The molds which had increased tensile strength due to the addition of combed cotton fibers to the negative moulage, were flattened out and photographed. As a result of this procedure, no difficulty was encountered in classifying the moulage fingerprints.

Having considered in some detail the methods and materials to be used for the perpetuation of original evidence in the third dimension, there remains the vital problem of utilizing this science, still in its infancy, in every possible situation encountered during the course of an investigation. This problem must be solved by the individual investigator through experimentation and intelligent application of the principles thus offered.

IDENTIFICATION DIVISION STATISTICS - OCTOBER 1936

On October 31, 1936, there was on hand in the fingerprint files of the Identification Division a total of 6,497,103 fingerprint cards. The fingerprint cards received twelve years ago at the outset of the present Identification Division of the Federal Bureau of Investigation represent approximately 12% of the total cards now on file in the Identification Division. This phenomenal growth in the number of finger impressions now retained in the Identification Division presages an extremely rapid growth of the files in the future.

The names of 51 law enforcement officers and agencies were added to the ever-increasing list of contributors of fingerprints to the Bureau during the month of October, 1936. The total number of contributors of fingerprints to the Identification Division at the present time is 10,121. During the month of October new fingerprint cards were received in the Bureau at the rate of 4,799 per day.

SPECIAL ANNOUNCEMENT

In last month's issue of the Bulletin a recent change in policy was called to the attention of contributors concerning the submission of applicant prints for search against the identification records to determine whether a criminal record exists. At that time it was stated that these applicant fingerprints may be submitted on the personal identification forms. It is again desired to point out specifically that when applicant fingerprints are forwarded they must bear the word "Applicant" in prominent letters thereon, preferably in the nature of a rubber stamped or distinctive impression, in order that the Bureau upon the receipt of these cards may be able to give them the requisite attention and see that they are searched against the criminal files. These prints then will be filed in the criminal records unless the law enforcement agency forwarding them makes specific request for their return.

The foregoing arrangement, as indicated, will enable the Bureau to identify these applicant prints readily and to afford more effective service to the law enforcement agencies transmitting such records for search against the criminal files. Unless the word "Applicant" appears on a fingerprint card prepared on the personal identification form, it will be routed to the Civil Identification Section without check against the criminal files, in accordance with the existing procedure.

SPECIAL ANNOUNCEMENT

In the next and succeeding issues of the FBI Law Enforcement Bulletin, there will be published a standardized list of abbreviations for use in quoting violations of Federal and State laws. The abbreviations appearing in this list are those found by the Bureau to be in most common usage by law enforcement agencies.

A similar list appeared in the FBI Law Enforcement Bulletins for June and July, 1934, but since that time the number of contributors receiving the Bulletin has increased so greatly that there has been a strong demand for a republication of these abbreviations. The current publication will contain a number of abbreviations not previously given and the form of abbreviation has been slightly changed in some instances. It will be noted that the form of presentation is also slightly different.

In the interest of law enforcement, it is hoped that all contributing agencies will make use of this standardized list whenever possible where the interpretation of an abbreviation is in question. It is suggested that, whenever feasible, a state code violation be indicated by the abbreviation of the offense rather than by reference to the code number. In this way the violations cited by one agency will be readily understood by other interested offices, and thus some confusion now existing among law enforcement agencies will be avoided.

RELATIONSHIPS OF CHIEFS OF POLICE AND THEIR IDENTIFICATION OFFICERS

Address By William A. Toler, President of the I.A.I.
Delivered Before the 1936, I.A.C.P. Convention

Mr. President, and members of the International Association of Chiefs of Police. It is with a sense of deep gratitude and the feeling of a distinct honor that I appear before you today to discuss the relationships of the Chiefs of Police and their identification officers. We who are engaged in the identification phases of police work have long recognized your President, our good friend, "Andy" Kavanaugh as one of the most competent and progressive officials in police circles. I am grateful to him and to you for this opportunity to discuss our problems before this distinguished gathering. At the same time I feel highly honored personally that I am the first President of the International Association for Identification privileged to address our "bosses." May I express the hope that this accounting of our stewardship may lead to a better understanding of our mutual problems and if I may so state--I intend to be entirely frank--a more sympathetic attitude by the Chiefs toward the modern needs of the identification men. At the same time, may I state that I hope these remarks, which I intend to repeat at our own annual convention at Dallas, Texas, next week, may serve to correct conditions in the identification organizations, where corrections are in order. There is much to be said on both sides.

The present idea of the bureau of identification in a police department is indeed a far cry from the early conception of this most important branch of an efficient police organization. Originally, several decades ago, we had detectives who possessed the so-called "camera eyes" such as our beloved deceased colleagues, John M. Shea and Mike Evans, who had the uncanny ability to detect and identify roving criminals after studying their pictures. Photographs of these criminals were next arranged in rogues' galleries which were the forerunner of the first systematic and scientific identification system, that devised by Alphonse M. Bertillon. The first regularly appointed identification officers were known as "Bertillon Men," usually upon the basis of some statutory enactment and these officers started Bertillon bureaus in their respective cities. This great association, recognizing the need of a centralized collection of Bertillon records, as you no doubt recall, organized the National Bureau of Identification in 1882. This was first placed in Chicago but later removed to Washington, D. C.

The duties of a Bertillon officer, while very technical, were relatively simple. He had a limited collection of records and was merely the record clerk in most instances. When the fallacies in that system were noted and it was gradually replaced by the fingerprint identification method from about 1905 to 1910, our troubles had just started. We have proceeded since from officers handling simple record systems to involved organizations within organizations, performing diversified and increasing tasks.

I do not want you to think that I am complaining about our lot. I am not. We are glad to be able to serve you. I do want, however, to point out that in most cities the man in charge of the bureau of identification is

not given the assistance as to equipment and personnel which his increased duties warrant. In most departments the bureau of identification serves a three-fold purpose; to record data as to current and prior arrests; to develop and identify latent evidence at the scenes of crimes; to prepare photographs of crime scenes and criminals and to assist in scientific work in many instances. Other functions are served in many cities, yet, despite our increasingly expanded activities, we must face the facts and admit frankly that in many places we do not make full use even of basic identification functions. There is not sufficient co-ordination between the police department, the detective bureau and the bureau of identification. In many cities all persons arrested are not fingerprinted even though the law permits. They are hurried through the courts and frequently are not even brought to the bureau of identification. This procedure may be attributed to any one of several reasons but inadequate personnel, to my way of thinking, is largely responsible. There is not sufficient personnel to take the prisoners to the bureau of identification and personnel there to fingerprint and photograph them and check their records. Fugitives do escape on account of the gaps in our system. Further, the psychological effect served by the fingerprinting of all prisoners is not accomplished. When all persons realize that they will be fingerprinted upon arrest, if they are fugitives they will be extremely careful to evade further conflict with the law and if they are possessed of previous criminal records, they will do their utmost to avoid the possibility of being fingerprinted, lest they are confronted with their previous records in court.

Many of us do not realize the full value of the advantages served by identification records. They tell the arresting departments and the detective bureau the identity of the person arrested and whether he is a fugitive. They enable that bureau frequently to develop investigative leads leading toward the apprehension of the associates of the person under arrest. They permit the prosecutor to present his case intelligently in court, and they afford the judge the opportunity to sentence the men equitably so the first offender may be given a lighter sentence if the case warrants or the habitual criminal made to serve the maximum term prescribed by law. At the same time they provide the parole and similar agencies with full information to enable those interested agencies to determine whether the persons whose cases are under consideration are deserving of any type of Executive clemency. In brief, they enable society, which we are all serving, to distinguish between the first offender and the habitual criminal and to punish each as he should be punished in the light of his depredations upon society. Yet, as I have stated, there are gaps in this system. There are holes in the net which we are endeavoring to throw around the criminals. Just so long as all fingerprints are not taken of all persons arrested, we cannot secure the best results. Further, so long as the officers in some cities think that merely because they are possessed of the criminal record of an individual his fingerprints need not be filed in a National collection, then so long are those officers depriving thousands of other agencies of information which frequently marks the beginning of a criminal career. These records are highly important. No criminal is truly "local" in character now. Each fits into the scheme of law enforcement on a national scale.

In order to secure a correction of this condition and in order to afford the Identification Division of the Federal Bureau of Investigation with complete information concerning these cases, may I plead with you today to endeavor to afford more assistance to the identification men in your respective cities in order that their services to you as identification men may become more valuable and to insure also that we may have complete records in each case. This is but one phase of our problem. There are others which I would like to point out today. Again, I am speaking in all frankness. I want to criticize emphatically the practice followed in many cities where individual members of police agencies are permitted to enter the identification bureaus freely and to withdraw records from the files. Better results can be expected if the head of the bureau is to be held responsible for the records in his organization. If the head of the bureau is a person of efficiency, there is no reason why he should not personally be held responsible for these records and to see that they are issued only to authorized sources making official requests therefor.

May I suggest also that the personnel for the identification bureaus should be selected carefully and, if its services are satisfactory, that personnel should be retained in office and accorded a salary inducement commensurate with the detailed and technical work performed. If this is done, better results can be obtained and greater standardization realized in the application of classification systems which too often are not uniform due to shifting and changing in the bureau of identification personnel. If there is one place where uniform interpretations must exist, that place is represented by the police department identification bureau.

In connection with this thought at this time I desire to convey to Mr. John Edgar Hoover, Director of the Federal Bureau of Investigation, my sincere thanks for his expansion to the field of the FBI National Police Academy courses which have been maintained at Washington. These field courses have permitted identification officers in various sections of the United States to attend fingerprint schools conducted by Bureau experts from Washington. These schools were sponsored by the International Association for Identification. We felt privileged to share in arranging for them. We feel greatly gratified by the results attained so far. Uniform interpretation and classification rules are being taught and understood by the students in attendance; standardized procedures are being outlined to the fingerprint men; the proper handling of wanted notices in their various phases is being explained and tremendous research facilities in the Bureau's Technical Laboratory are being utilized in the courses with reference to the proper handling of latent and other scientific evidence. May I predict that through the conduct of these schools upon a national scale, we will attain increasingly effective results in the identification field.

I wanted to mention also another aspect of the work of the local identification bureaus as represented by their scientific crime laboratories. While we are very glad to assume this additional work, may I beg of the Chiefs that when problems of this character are undertaken, they consider the additional highly trained personnel which must be required to handle scientific analysis properly. Unless personnel can be selected and

trained who possess the proper background of education and training, we cannot expect the best results and we cannot afford to the Chiefs the maximum service which they desire. Let us be aggressive in undertaking these new projects, but conservative in seeing that they are properly established before they are used fully.

The same thought is presented with reference to the inauguration of single fingerprint files. These are technical activities of a highly specialized nature and as such warrant and demand the best ability at our command.

I cannot close this talk without referring to the so-called air of mystery which is reported to have permeated the various identification bureaus in the past. This is often cited by Chiefs. May I indicate that no air of mystery prevails any longer in a bureau of identification. But, why was this opinion started? Why did the mysterious air exist? I want to state that in all frankness that it was because some police were skeptical of the value of fingerprints, the first really scientific adjunct to law enforcement. They were as skeptical of the value of fingerprint evidence as they are often today of certain phases of scientific work. They doubted the possibilities inherent in this system and criticized it as an innovation having little value. The result was that the identification officer adopted a defensive attitude. He knew he had something useful but in many instances because of the defensive attitude he did permit an air of mystery to creep into his work. This has been largely dispelled through the practical, illuminating and constructive steps taken in recent years to indicate that fingerprint evidence is nothing mysterious or prevailing in the realms of leg-erdemain. This work is now firmly established upon the solid basis of scientific fact. Similar results will attend our endeavors in the field of other scientific effort, if we approach the problems cautiously, conservatively and confidently, assisted by the definite thought that we have something of positive use to police and society in their warfare on crime.

May I beg of you to afford to your identification man a little more attention, considerable more assistance in personnel and equipment and last but not least a sympathetic and understanding attitude concerning his work and his efforts. I am sure that you shall be amply repaid with more substantial returns in better service, and with the more effective administration of our duties to make our work more valuable to ourselves, more valuable to you and more valuable to society.

INTERNATIONAL FINGERPRINT EXCHANGE

Law Enforcement agencies will be interested to know that at the present time there are seventy-nine foreign countries cooperating with the Identification Division of the FBI in the International Exchange of Fingerprints.

The Dutch West Indies and Nicaragua have been the latest to become contributors.

THE FACTOR OF AGE IN RELATION TO CRIME

The seriousness of the problem of juvenile delinquency is manifested by records which show that 17 out of every 100 persons arrested during the first nine months of 1936 were under 21 years of age. This fact was gained from the examination of 343,132 arrest records of persons whose fingerprints were forwarded to the Federal Bureau of Investigation during the first nine months of 1936 by state and municipal law enforcement agencies.

During the past four years the Bureau has been making an analysis of fingerprint records covering arrests, and throughout this period, until the last half of the calendar year, 1935, arrests of individuals 19 years of age outnumbered those for any other single age group. The arrest records received since June, 1935, reveal a shift in the majority of individuals arrested to the ages of 21, 22, and 23 years. Whether this is attributable to the nineteen-year-old age group continuing its criminal tendencies and becoming second offenders, to the effectiveness of the concerted drive against crime, or to an improvement of economic factors is a matter for speculation. The trend, however, is being noted and observed and by future comparison, it should be possible to ascertain its significance and to determine if it is of a permanent or temporary character.

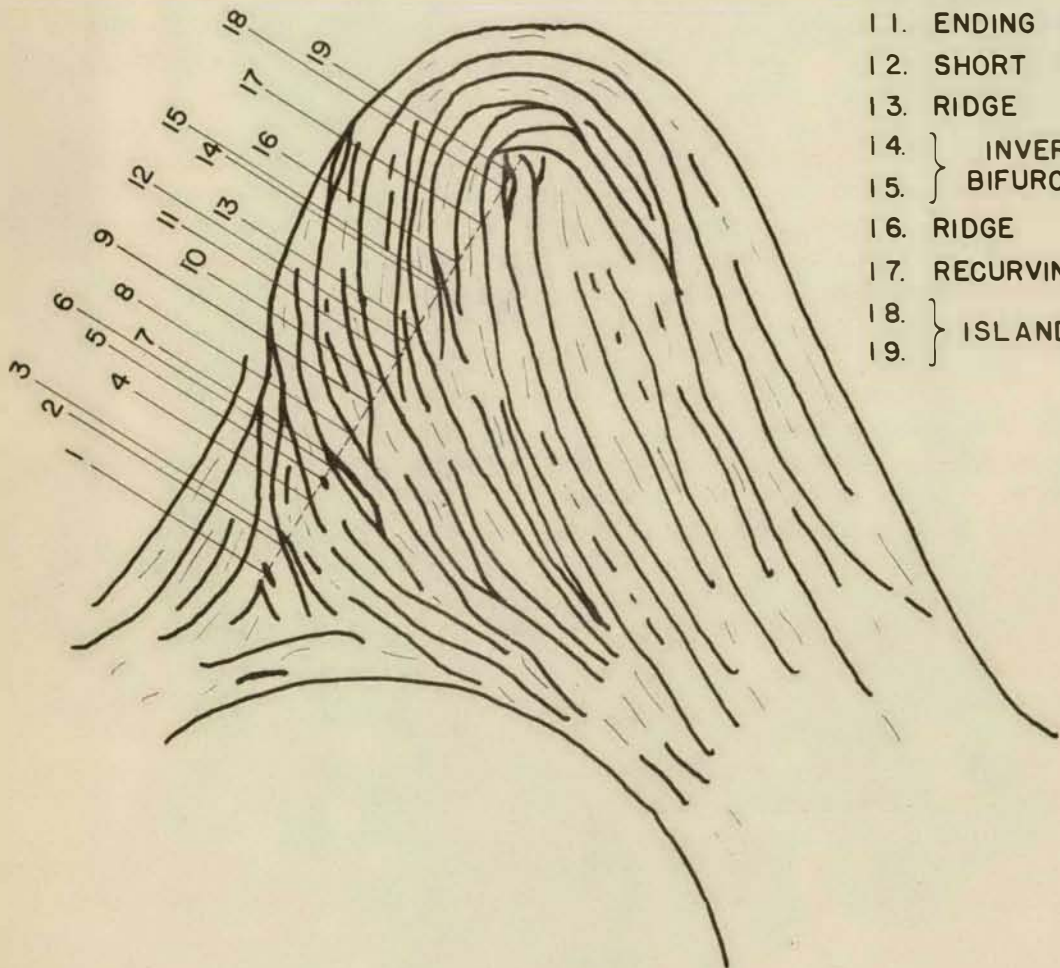

The age groups for which there were the most numerous arrests during the first nine months are as follows:

<u>Age</u>	<u>Number Arrested</u>
21	15,247
22	15,179
23	
19	14,328

The compilation disclosed that during the first nine months, 9,763 individuals were arrested and charged with robbery, 22,352 with burglary, and 8,351 with auto theft. The predominance of youth in these types of crimes is shown by the fact that 5,243 (53.7%) of those persons arrested and charged with robbery, 13,087 (58.5%) of those charged with burglary, and 5,892 (70.6%) of those charged with auto theft were under 25 years of age.

One out of every 4 persons arrested for robbery during the first nine months of 1936 was under 21 years of age. Similarly, one out of every 3 persons arrested and charged with burglary was less than 21 years old. Auto theft, the statistics show, was frequently committed by youthful individuals. Of the 8,351 arrested for auto theft 3,944 were under 21 years of age.

During the first nine months of 1936, more than one-sixth of the 343,132 persons arrested had a record of arrests previous to attaining their majority. Approximately 34 per cent of those arrested were less than 25 years of age.

COUNTING RIDGE COUNTS

From the correspondence recently received in the Bureau's Identification Division, it appears that many peace officers are interested in a standardized method of ridge counting of finger impressions. At this time, therefore, there is presented for discussion a drawing of a fingerprint pattern which contains most of the questionable elements, together with descriptive data illustrating how such ridges are counted in the Federal Bureau of Investigation. (See drawing on opposite page.)

The fine or thin lines which are fragmentary ridges are not counted. It will be noted that on counts 2 and 3, 6 and 7, 14 and 15, and 18 and 19, the imaginary line drawn between the delta and the core crosses each bifurcation to permit the counting of two ridges. Particular reference is made to counts indicated as 6 and 7. In the instances where the imaginary line crosses the point of bifurcation the technical employees in the Federal Bureau of Investigation count two ridges but bear in mind the need for referencing the same as one. This is a rule adopted in the interest of uniformity because frequently it is impossible to tell where the exact point of bifurcation occurs.

This standardized system of ridge counting as employed in the Federal Bureau of Investigation produces an accurate ridge count for filing purposes. However, in those instances when a change in inking might affect the ridge count and thereby vary the classification, appropriate reference searches should be conducted.

CRIMINAL RECORD ABSTRACTS

It is the policy of the Bureau in answering a current print received in the case of a fugitive to wire only where the arrest is of a temporary nature or the disposition is not shown on the fingerprint card. Where it appears from information contained on the fingerprint card received in the Bureau, reflecting a current arrest, that the fugitive subject will not be released in a short time the interested parties are notified by air mail when practicable.

It is suggested that these abstracts be given prompt examination when received inasmuch as delay in this respect sometimes results in the release of a subject before his fugitive status has been noted.

Cooperation of law enforcement agencies in this matter will result in greater advantages being derived from the services offered by the Bureau.

It is suggested further that when subjects of wanted notices placed in the fingerprint files of this Bureau are apprehended the law enforcement agency that requested the placing of the wanted notice advise this Bureau when custody of the wanted subject is obtained so that the wanted notice placed in the Bureau files may be removed.

**HARRY KOVENSKY, WANTED SINCE 1931 IN PORTLAND, MAINE,
IDENTIFIED THROUGH FINGERPRINTS**

On January 9, 1933, information was received in the Bureau that one Harry Kovensky had escaped from the County Jail, Portland, Maine, where he had been received for the crime of larceny. A wanted notice was posted against the fingerprint file of this person in the Identification Division of the Bureau to the effect that any subsequent information received should be communicated to the Sheriff's Office at Portland, Maine. From the fingerprint file of this individual information is reflected that on September 8, 1931, he was arrested by the Police Department, Portland, Maine, for the crime of larceny and sentenced to the Men's Reformatory.

Information was again received from the Sheriff's Office, Portland, Maine, on November 29, 1935, to the effect that this individual had escaped while awaiting an appeal on sentence of ten to twenty years for robbery.

The next information received in the Bureau, indicating that this individual was in custody, was forwarded by the Correction Farm, Warrensville, Ohio, when the fingerprints of one Arthur Goodwin were received from that institution reflecting his receipt there on September 30, 1936, on a charge of common beggar sentenced to serve thirty days and pay a fine of \$30.65. When the prints from Warrensville, Ohio, were received in the Bureau a wire was dispatched immediately to the Sheriff at Portland, Maine, advising that Harry Kovensky was serving a thirty day sentence in the Correction Farm at Warrensville, Ohio, under the name of Arthur Goodwin.

A letter received subsequently in the Bureau from the Portland, Maine, authorities indicated that through the Bureau's identification of Goodwin it had been possible to take into custody a man named Kovensky who had been missing from the Portland jurisdiction for five years, having made his escape from the local jail while waiting for a decision from the Law Court, to which the subject had appealed a sentence of from ten to twenty years for robbery.

**JAMES SAUNDERS WANTED FOR ESCAPE IDENTIFIED
BY SINGLE FINGER IMPRESSION APPEARING
IN FBI LAW ENFORCEMENT BULLETIN**

One of the important functions of the Federal Bureau of Investigation is the publication of the monthly FBI Law Enforcement Bulletin. A large section of each issue of this bulletin is devoted to the single finger impressions and descriptive data of a number of fugitives whose apprehension is desired by various law enforcement agencies throughout the United States.

Included in the wanted notices thus published in the February, 1936, issue of the bulletin was one indicating that the Sheriff at Morristown, New Jersey, desired the apprehension of an individual giving the name of James Saunders.

On October 19, 1936, among the fingerprint cards received from the Police Department of Denver, Colorado, was one indicating the arrest of an individual giving the name of Douglas Gladstone. According to the information appearing on this fingerprint card Gladstone had been identified by the Denver authorities, through the medium of the single finger impression appearing in the FBI Law Enforcement Bulletin, as being the same individual who, under the name of James Saunders, was wanted for escape by the Sheriff of Morristown, New Jersey. It was indicated that Gladstone had originally been picked up for investigation and later, after his identity had been established, the charge was changed to fugitive. On October 26, 1936, Gladstone was returned to the Morris County Jail from which he had escaped on August 19, 1935, while serving a six months sentence.

It may, therefore, be said that the apprehension of this felon was due almost entirely to the fact that this single finger impression had been published in the FBI Law Enforcement Bulletin.

OFFENSES KNOWN TO THE POLICE, SEPTEMBER AND OCTOBER, 1936

Each month there are received at the Bureau reports based on the number of offenses committed in the various cities throughout the United States. These reports are submitted by local law enforcement agencies and are published in the bulletin "Uniform Crime Reports" at the close of each quarter of the year. Current information, however, on the monthly fluctuation of the amount of crime will be found of value to law enforcement officials. In order that such information may be available there is presented below the number of major offenses reported for the months of September and October, 1936 by the police departments of 64 cities with a total of 19,803,028 inhabitants.

For the offenses of murder, rape, aggravated assault and burglary the figures disclose a decrease during October as compared with September. The remaining offense classes, however, show an increase in the number of crimes committed daily.

Daily average, offenses known to the police, 64 cities over 100,000
September and October, 1936
(Total population 19,803,028, as estimated July 1, 1933
by the Bureau of the Census)

	Criminal homicide		Rape	Rob- bery	Aggra- vated as- sault	Bur- glary- break- ing or enter- ing	Larceny- theft	Auto theft
	Murder, nonneg- ligent man- slaugh- ter	Man- slaugh- ter by negli- gence						

Number of Offenses known:

September, 1936	136	57	159	1,308	958	6,159	14,295	3,578
October, 1936	135	68	136	1,465	872	5,970	16,454	3,944

Daily Averages:

September, 1936	4.5	1.9	5.3	43.6	31.9	205.3	476.5	97.2
October, 1936	4.4	2.2	4.4	47.3	28.1	192.6	530.8	107.7
