

F B I

LAW ENFORCEMENT BULLETIN

A complaint was filed before a United States Commissioner at Denver, Colorado on September 23, 1935, against Joe Pannell, charging him with having on or about August 9, 1935, unlawfully fled in interstate commerce from Denver, Colorado to Mexico, Missouri for the purpose of avoiding prosecution under the laws of the State of Colorado. On August 2, 1935 Pannell and another robbed Max Schwartz of \$24,000 in stocks, bonds, cash and jewelry at his place of business, the Schwartz Realty Company in Denver, Colorado. In November, 1935 Schwartz was shot down with a sawed-off shotgun on the street in Denver, Colorado and subsequently died. Pannell is the subject of Identification Order #1324 issued by the Federal Bureau of Investigation."

Federal Bureau of Investigation
U. S. Department of Justice

John Edgar Hoover, Director

Washington, D. C.

VOL. 5 NO. 5

MAY 1, 1936

The Federal Bureau of Investigation, U. S. Department of Justice, is charged with the duty of investigating violations of the laws of the United States and collecting evidence in cases in which the United States is or may be a party in interest.

The following list indicates some of the major violations over which the Bureau has investigative jurisdiction:-

National Motor Vehicle Theft Act
Interstate transportation of stolen property valued at \$5,000 or more
National Bankruptcy Act
Interstate flight to avoid prosecution or testifying in certain cases
White Slave Traffic Act
Impersonation of Government Officials
Larceny of Goods in Interstate Commerce
Killing or Assaulting Federal Officer
Cases involving transportation in interstate or foreign commerce of
any persons who have been kidnaped
Extortion cases in which interstate commerce or interstate communication
is an element
Theft, Embezzlement or Illegal Possession of Government Property
Antitrust Laws
Robbery of National Banks and Member Banks of Federal Reserve System
National Bank and Federal Reserve Act Violations, such as embezzlement,
abstraction or misapplication of funds
Crimes on any kind of Government reservation, including Indian Reserva-
tions or in any Government building or other Government property
Neutrality violations, including the shipment of arms to friendly nations
Frauds against the Government
Crimes in connection with Federal Penal and Correctional Institutions
Perjury, embezzlement, or bribery in connection with Federal Statutes or
officials
Crimes on the high seas
Federal Anti-Racketeering Statute
The location of persons who are fugitives from justice by reason of vio-
lations of the Federal Laws over which the Bureau has jurisdiction,
of escaped Federal prisoners, and parole and probation violators.

The Bureau does not have investigative jurisdiction over the violations of Counterfeiting, Narcotic, Customs, Immigration, or Postal Laws.

Law enforcement officials possessing information concerning violations over which the Bureau has investigative jurisdiction are requested to promptly forward the same to the Special Agent in Charge of the nearest field office of the Federal Bureau of Investigation, U. S. Department of Justice. The address of each field office of this Bureau appears on the inside back cover of this bulletin. Government Rate Collect telegrams or telephone calls will be accepted if information indicates that immediate action is necessary.

Interesting Identifications		26, 28
Fugitives Wanted		27
Apprehensions		30

The F B I LAW ENFORCEMENT BULLETIN is published by the Federal Bureau of Investigation, United States Department of Justice each month. Its material is compiled for the assistance of all Law Enforcement Officials and is a current catalogue of continuous reference for the Law Enforcement Officers of the Nation.

John Edgar Hoover, Director
Federal Bureau of Investigation
U. S. Department of Justice
Washington, D. C.

There are three great factors to law enforcement; they are crime prevention, crime detection, and prosecution. Although we are largely concerned with the crime detection phase of our great law enforcement problem, we should not be unmindful of the other two factors.

I think that the crime detection phase of law enforcement has made greater progress than either crime prevention or prosecution although this is frequently ignored and many times individuals are inclined to lay all blame and burden upon those responsible for crime detection, when something goes wrong in the broad field of law enforcement in some community.

The task of the law enforcement officer is at times a trying one. On a page following, there is set out a poem dedicated to peace officers throughout the country. It portrays very well some of the difficulties that constantly beset the officer and with what fortitude he must go about his duties.

To carry on a work of public service, despite the difficulties encountered where assistance should be forthcoming, requires men of character. Necessarily there must be men of brawn and we must have men of brains, but most important is the need for men of character in law enforcement work; men who are constantly alert at all times as to their own personal and official responsibilities. Men of such caliber, although charged with the specific duty of crime detection, will work with a full appreciation of the three broad fields of activity and will not become warped or blinded as to the interlocking of the factors in the problems of law enforcement. Their leadership will set the ideals for greater progress in law enforcement.

A handwritten signature in dark ink, reading "John Edgar Hoover". The signature is written in a cursive, flowing style with some loops and flourishes.

Director J. Edgar Hoover presenting Diploma to Mr. Joseph T. Owens, President, Second Police Training School, at the Graduation Exercises held March 28, 1936, at the FBI Headquarters, Washington, D. C.

EXERCISES TERMINATING THE SECOND FBI POLICE TRAINING SCHOOL

The second police training school of the Federal Bureau of Investigation was closed with appropriate exercises on March 28, 1936. In a brief ceremony presided over by Director J. Edgar Hoover, twenty-seven law enforcement officials, representing police departments and law enforcement agencies in various parts of the United States, received diplomas.

The course of training afforded the members of the second police training school, which began on January 6, 1936, consisted of lectures and practical demonstrations by experts connected with the Federal Bureau of Investigation, in addition to lectures by outstanding criminologists and police officials from throughout the country. The courses of instructions covered scientific and technical subjects: Statistics, Records and Report Writing; Firearms Training and First Aid; Investigations, Enforcement and Regulatory Procedure; Tests and Practical Experience; and Police Administration and Organization.

The following officers received diplomas:

H. M. Adair	Columbus, Georgia, Police Dept.
Earl C. Boatright	Colorado Springs, Colorado, Police Dept.
E. P. Bogasch	San Antonio, Texas, Police Dept.
Glen Boyd	Winnetka, Illinois, Police Dept.
Louis A. Burgess	Salem, Oregon, Police Dept.
George D. Callan	Newark, New Jersey, Police Dept.
Sherman Cannon	Jacksonville, Florida, Police Dept.
Howard L. Clayton	Sheriff's Office, Desha County, Arkansas
A. E. Crawford	Jackson, Mississippi, Police Dept.
Edmund S. Crowley	Providence, Rhode Island, Police Dept.
A. T. Deere	New York Office, F. B. I.
John D. Dennison	Omaha, Nebraska, Police Dept.
Charles Esken	Peoria, Illinois, Police Dept.
N. G. Falkenstine	Maryland State Police
O. D. Garton	Richmond, Virginia, Police Dept.
Harry C. Gornto, Jr.	Norfolk, Virginia, Police Dept.
Lindsey Hatchett	Arkansas State Police
F. F. Kaminsky	Sacramento, California, Police Dept.
Ernest A. Littlefield	Phoenix, Arizona, Police Dept.
Brooks W. Lowentrout	Riverside, California, Police Dept.
R. R. McDonald	Los Angeles, California, Police Dept.
Daniel A. Murphy	Massachusetts State Police
Joseph T. Owens	Rome, New York, Police Dept.
Fred C. Philby	Louisville, Kentucky, Police Dept.
N. O. Scott	Kansas City Office, F. B. I.
Charles E. Tettermer	Trenton, New Jersey, Police Dept.
R. J. Untreiner	Washington Field Office, F. B. I.

YOU'RE A POLICEMAN

Dedicated to Law Enforcement Officers Throughout the United States

When the hours seem long and the going, rough
When the pay seems small and the criminals, tough
Just square your shoulders and call their bluff
Let them be the ones to cry, "Enough",
You're a policeman.

When the public scoffs and the papers rave
And blame you alone for a new crime wave
They'll change quick enough when there're lives to save
For deep in their hearts they count you brave
You're a policeman.

When politics steps in and ties your hands
With ward heeler tactics and raw demands
Do the best you can despite these bands
They'll go their way, while the force still stands
You're a policeman.

When you bid your loved ones goodbye each day
Don't be too sure you've the harder way
You shoot it out with the crook at bay
They're the ones who sit at home and pray
You're a policeman.

When you get back home dog tired at night
And wonder if life's really worth the fight
Your cares will vanish and burdens seem light
If you've done your best and your conscience's right
You're a policeman.

When promotion comes, as it surely will,
If you do your job and are loyal still
Don't forget soon in your new found thrill
Those others who are plodding up the hill
You're a policeman.

When you leave at last this worldly din
And seek, like mortals, Paradise to win
Saint Peter, I trust, will o'erlook ev'ry sin
And say, "Well done, my boy, come right in."
You're a policeman."

--W. H. Drane Lester,
Inspector - F. B. I.

WHY EVERY POLICE OFFICER SHOULD LEARN TO SHOOT BY CAPTAIN JAMES C. DOWNS.

The following article by Captain James C. Downs of the Baltimore, Maryland, Police Department, is being reproduced herein for the attention of law enforcement officers throughout the country because of the vital importance of the subject matter to them.

"During my experience as Patrolman, Sergeant, Lieutenant, Captain and originator and director of many branches of training in the Baltimore Police Department, I have made a thorough study of the capabilities of policemen in general and the requirements necessary for efficiency in the job of protecting life and property, enforcing laws and arresting dangerous criminals.

"It is my opinion that if the policeman of today would take his job more seriously, study the laws and other requisites necessary for him to know about his job, feel the importance of his responsibilities, keep in fit physical condition so that he will look like a policeman, and when he is called upon to act the part he will be able to do so in a manner that will bring credit to himself and to the Department he represents, and when assigned to a case to make his report in a scholarly and thorough manner and when called to the witness stand to testify to do so in an efficient, gentlemanly, courteous and impartial manner. Then and not until then will the policeman take his place with members of the other two great branches of the Government of the State and be recognized and respected as members of an honored profession.

"Judges, Lawyers, Physicians, Teachers and members of all recognized professions are at all times ready and willing to fulfill their duties to the community and so it should be with the professional policeman. He should consider himself on duty at all times and act his part to the credit of himself and to his profession.

"In making a general survey of Police Departments in many of our cities, I find that many of them neglect to educate the members of their police force in the very necessary use and care of firearms both as a protection of life and as a very important asset when testifying in court regarding the use of firearms in the taking of a human life.

"The most important function of an efficient policeman is to protect life and property. The law therefore provides that as a peace officer he may carry concealed upon his person a revolver for the protection of his own life as well as the lives of others. When face to face with a criminal who is armed, a revolver is useless as a protection to life in the hands of one untrained in the art of shooting. The most perfect athlete, though he be a giant in size, is powerless before the poorest weakling who is armed with a revolver and knows how to shoot.

"We have every reason to believe that criminals carry guns although in violation of the law, and very often for the purpose of killing any policeman who may attempt to arrest him, as arrest means to them the giving

up of a great many years of life, or life itself in atonement for a crime previously committed. Very often this character of criminal will shoot and knows how to hit what he shoots at.

"Any one who can pull a trigger can discharge a revolver, but unless trained can seldom hit a mark when more than ten yards away as the natural tendency is to jerk the muzzle of the revolver off the mark after taking careful aim. For this reason the mere fact that a police officer carries a revolver upon his person is very little proof of his effectiveness as a protector of the lives of citizens or his own life when called upon to prevent the commission of a serious crime or to arrest criminals. In all cases the handling of guns by a novice is dangerous, not only to himself but to every person within gunshot distance and the lives of citizens would be better protected if untrained police officers were compelled to carry a brick instead of a gun.

"It is a notorious fact that a very small percentage of policemen today know the first rudiments of revolver shooting and unfortunately this fact is generally known by the most dangerous criminals. It is a serious problem when we stop to think that 80% of our police cannot hit a man standing across the street in a cool, collective manner, so we can imagine what will happen in a case when he has to shoot quick and accurately.

"Every man who chooses the police profession as his business is required to take a solemn oath to detect and arrest violators of the law which includes persons who commit every class of crime from petty misdemeanors to murders. It is a simple thing to arrest law-abiding citizens who through carelessness or ignorance of law or ordinances violate some of them. Police working posts form the dangerous habit of calling upon persons who have committed such petty violations of the law to submit to arrest with every assurance that the person to be arrested will submit peacefully. Usually respectable citizens do submit to arrest upon the demand of a police officer and this results in the police officer forming a bad habit that sometimes brings him to grief.

"While the revolver takes no conspicuous part in the arrest of persons charged with petty crimes, there are times nevertheless that its presence has a very good effect upon the person arrested, he knowing that a revolver is resting peacefully under the officer's coat and the effect is increased when the prisoner knows that the officer has a reputation of being a good marksman.

"The policeman, of course, forms some bad habits, one of which is carelessness in trying doors or looking for criminals; he goes into an alley where criminals may be at work, having his revolver carefully tucked away in his hip pocket of his trousers, buried in an old holster with cartridges which, as many of them will tell you, have not been taken from the chamber for a number of years. The revolver rusted and so corroded that it is unsafe to shoot. He finds the door or window which the criminal has broken open and calls the proprietor a few names for his supposed carelessness and looks around for a telephone to notify the station house that the owner may be notified to come and lock the door, when suddenly he hears a

report ring out from a revolver in the hands of the criminal. This class of policeman is unfair; he is unfair to himself, unfair to his wife and children, unfair to the Department, for he is ignoring the privilege the law has given him to carry a real revolver and he is disobeying the rule of the Department and the instructions given him by the Department Firearms Instructor.

"I, personally, have instructed every member of our Department how to use and care for their service revolver, and never to enter a place where a serious crime has been committed or where a criminal is likely to be, without first placing his revolver in a handy place. If he told his wife and family that he loved them or even cared what was to become of them in later years, and most policemen have large families or some others depending upon him, he lied to them if he cared so little for his life that he caused a funeral bill and possibly caused his loved ones to suffer because of his negligence in not being properly prepared at the time when the test came. There has never been a truer saying than 'A man may need his gun only once in a lifetime, but when he needs it he needs it mighty bad.'

"Please remember the following few words. The revolver is or should be the most important part of a policeman's equipment. It is his best and only friend in the early hours of the morning when, far away from assistance, he comes in contact with an armed criminal, - his life depending upon the answer to his call to the only instrument left him for the protection of his life when the decision is to be rendered as to whether he is to be spared to protect his loved ones at home. He calls upon his revolver to defend him from harm for the first time in his career as a policeman. He then realizes the importance of knowing how to shoot.

"It is my earnest appeal to every man who has taken the oath the same as I have taken, to protect life and property - to give this serious thought and consideration, as a man is known or judged by the company he keeps, so is your efficiency in protection of life measured by the revolver you carry. Life may not mean much to you but be considerate of the loved ones at home. The best revolver on the market is not too expensive when you consider what depends upon it. You have the best revolver money can buy. Learn to use it accurately and always keep it loaded with the very best of cartridges.

"What body of men, so feared and respected, could be a more signal example of the advantages of knowing how to shoot than the United States Marine Corps. Seldom, if ever, is the Marine found who does not wear both the rifle and revolver "Expert" medal. And why is the Marine trained to shoot with such precision? The Marine is required to attain a high rating of efficiency in the use of firearms for the same obvious reason that all police officers should, because he acts in the role of protector over the lives and property of citizens.

"Considering this fact, it quite naturally follows that the police officer, who we all know is required to carry a loaded revolver off duty as well as on duty, is no different from any other individual with a

loaded gun who is not able to use it accurately. He is more apt to be a menace to the public than a factor of safety.

"What greater comfort and feeling of security can an officer have, patrolling his beat in the wee small hours of the morning, than the knowledge that strapped to his side is the finest gun money can buy, coupled with the ability to use it with speed and deadly accuracy if circumstances necessitated. About the only physical sensation to surpass it would be the ability to walk on water.

"Truer wisdom was never displayed than the recent expression by our own Police Commissioner, published in the Baltimore papers wherein General Gaither stated in part, 'It hasn't been so very long ago when the greatest source of danger to the police officer came in the form of some oversized inebriated tough who sought to work off some of his exhuberance and at the same time attain fame among the lesser toughs by striking the officer or throwing a brick-bat at him. However, today the situation is vastly different. The dangers are deadlier and the source harder to recognize as it comes in the form of the immaculately attired youth who shoots to kill on the least provocation.'

"A comment like this from one who has devoted his energies and appropriated every available bit of money toward equipping the Baltimore Police Department as second to none should be nothing short of conductive to the best efforts of all police officers in acquiring a thorough knowledge in the use and care of his service revolver. There isn't any better life insurance available.

"As another inducement to become an expert with the revolver, I want to say that, in all the years I have handled guns and instructed in their use, I have yet to know of a case where a police officer, who really being an expert, ever had to kill a man or get hurt himself except where he was absolutely driven to it. It isn't the officer who knows how to shoot quickly and accurately that shoots when he should not, bringing down adverse criticism on the whole department. It is invariably the officer whose gun feels about as familiar in his hand as the paw of a Bengal tiger.

"If there is anybody in the world who should be able to shoot straight and quickly it is the American police officer. The very nature of your vocation brings you face to face with the criminal element. This is true from the defensive as well as the offensive viewpoint. You never know at what moment life may depend on your ability to draw quickly and shoot accurately.

"As the representative of law and order, you are expected to go after criminals as well as defend yourself. You are not expected to kill, but you must bring in your man. It is your duty to disable the fugitive or by strategic shooting so cower the crook that he will submit to orderly arrest. To do this - to fulfill your whole duty as an officer of the law - you must be an accurate marksman, not a chance shooter.

"It is no reflection on you or any police officer to say that the average police officer cannot shoot with accuracy. Nobody could possibly be or become an expert shot without instructions and practice.

"As regards instruction in the art of shooting, let me say here and now that such a thing as a born shot has never been heard of and nothing short of the proper training and consistent practice will create a good shot. Another item, which should be food for real serious thought toward developing your ability in the use of the revolver is the fact that a gun shoots just as hard for a boy as it does for a man, making all men equal.

"You may be ever so powerful physically, but facing a gun in the hands of any individual, bent on a criminal act, you will find yourself helpless as a babe in arms.

"It is often said that one's reputation goes before him and that holds true of the crack-shot with the revolver more so than anything else. Once you have established the fact that a man's arm or leg is a large target for you, your reputation as an expert with the revolver will precede you into the camps of the criminally inclined as well as the homes of the better citizens of any community and its a hundred to one the public enemy will give you a wide berth. Such a reputation will make you liked and respected among those whom any officer would like to call his friends.

"In conclusion of my efforts here, which I assure you were actuated by a sympathy way deep within, to convey to all you officers the advantages of knowing how to shoot with speed and accuracy I want to say that for any little service I may be to you along the line of firearms, nothing will please me better than to learn, following the next gun fight, where the officer attended the Coroner's inquest instead of some gun-punk. Cartridges are cheaper than pensions."

* * * * *

CARE OF FIREARMS

Pistols or revolvers, like other steel or iron made objects, will rust unless kept oiled or greased. In fact a pistol is possibly more likely to rust than other objects of steel, as it may be handled frequently in hot weather with moist hands, causing the film of perspiration left on the gun's surface, to have a chemical effect which will result in rusting in a very short time.

In order to preserve a gun from rust, it is necessary to wipe the surface with a slightly oily cloth after the gun has been handled and before putting it away. This will prevent the fingerprints showing up as rust spots. In the summer season additional care should be given to side arms since leather holsters also attract moisture and will tend to cause rusting. It is, therefore, suggested that the side arm be wiped with a slightly oily cloth at regular intervals.

IDENTIFICATION AIDED BY BLOOD COMPARISON

An investigation conducted by FBI Special Agents in a case of assault with intent to murder committed at Fort Monroe, Virginia, revealed that Elvira Barbour, a colored cateress working at Fort Monroe, had been brutally attacked one evening shortly after she had retired to her room on the fourth floor of the servants' quarters. Her assailant struck her over the head several times with a weapon which the victim believed to be the butt of a pistol. An examination of the victim's room shortly after the assault revealed numerous blood stains on the bedclothes and on the floor near the bed. A cartridge chamber was found on the bed which had the appearance of apparently having become detached from a revolver. William Jones, a negro, who had previously worked under the supervision of Elvira Barbour, but who had been discharged by her for inefficiency, was found lying under the window with a broken back. In Jones' possession was found a revolver frame badly stained, a knife, two keys, and some bullets.

The investigating agent forwarded to the Technical Laboratory of the Bureau the revolver frame which was covered with stains, and the cartridge cylinder which was found in the victim's room. It was requested that efforts be made to ascertain whether the stains found on the gun frame were blood stains and if so whether the blood was of human origin. It was further desired to determine whether the cartridge cylinder could be identified as coming from the revolver frame.

The examination of the stains found on the revolver frame showed conclusively that they were blood stains of human origin. The laboratory examiner further established that the blood found on the revolver belonged to Group "A." A blood specimen secured from the suspect Jones was examined and found to belong to Group "O" whereas a blood specimen of the victim was found to belong to Group "A." The laboratory examiner was, therefore, able to conclude that the blood found on the revolver could not possibly have been that of the suspect but could have been the blood of the victim. The examination of the revolver cylinder indicated that it belonged to the revolver frame found in the possession of the subject.

Jones signed a statement admitting that he had attacked Elvira Barbour, hitting her over the head with the butt end of a pistol, because of having a grudge against her for discharging him. He stated that he had climbed out on the roof in an effort to escape and had slipped, causing him to fall four floors to the ground where he was found when apprehended.

Upon recovery from his injuries, Jones entered a plea of guilty to a charge of assault with attempt to murder on a Government reservation and was sentenced to serve ten years in the State Penitentiary at Atlanta, Georgia. The case is believed of particular interest not only in view of the fact that the revolver cylinder was identified as that coming from the revolver found on the person of the suspect and the comparison of blood groups, but also in that the completion of the investigation was effected despite the fact that a confession was obtained, thereby avoiding the possibility of an unsuccessful prosecution due to a revoked statement or lack of available incriminating evidence to secure a prosecution without the confession.

DETERMINATION OF ALCOHOLIC INTOXICATION DURING LIFE BY SPINAL FLUID ANALYSIS

By ALEXANDER O. GETTLER and A. WALTER FREIREICH

(From the Chemical Laboratories of Bellevue Hospital
and of Washington Square College, New York University,
New York)

The following and last in a series of articles is published through the courtesy of the authors, Dr. Alexander O. Gettler and Dr. A. Walter Freireich of the Chemical Laboratories of Bellevue Hospital and of Washington Square, New York University, New York, to acquaint those interested with the several methods of procedure practiced by analysts in their determination of alcohol in blood and other body fluids.

"In a paper (1) published from our laboratories, Gettler and Tiber described a method for the quantitative estimation of the alcohol content of the brain, lungs, and liver. In another paper (2) the same authors showed that the quantity of alcohol in the brain determines the degree to which an individual is affected by the alcohol--an index of intoxication. It is evident, however, that this method is applicable only to cadavers. In seeking a method for proving intoxication in living individuals, it occurred to us that perhaps the alcohol content of the blood or spinal fluid would be of value. The problem confronting us was to analyze the brain, blood, and spinal fluid of cadavers, and the blood and spinal fluid of living alcohol drinkers, and then determine whether there is any constant relation between the alcohol content of the brain and that of the blood or of the spinal fluid. It is upon this work that we wish to report.

"The method used in this investigation is the same as that outlined by Gettler and Tiber (1) for the brain and other tissues. Certain details of the method had to be modified because the amounts used for analysis were much smaller, the blood is a coagulating fluid, and the acidity control may have a different value. The changes introduced were as follows:

"10 cc. of blood or spinal fluid were used for the analysis.

"Paraffin was used to prevent frothing; it served the purpose better than white mineral oil.

"Steam distillation was made use of. The flask containing the blood or spinal fluid, however, was not heated. Steam alone was used for heating and distilling. In this way, in the case of blood, an ungainly coagulum adhering to the flask was avoided. The steam gradually coagulated the blood, while in motion, disintegrating the coagulum into small particles.

Amount of Distillate Required to Recover All of the Alcohol Present

"10 cc. portions of blood and of spinal fluid from cases in which the brain showed a high alcohol content were distilled with steam.

The distillate was collected in successive 10 cc. portions, until 100 cc. were obtained. Each 10 cc. portion of distillate was oxidized and then tested with reduced fuchsin. The results are tabulated in Table I. It was found that all the alcohol was recovered in the first 70 cc. of distillate.

TABLE I

Amount of Distillate Necessary for Complete Recovery
of Alcohol from Blood or Spinal Fluid

: Alcohol :		Alcohol found in successive 10 cc. portions of distillate*							
Case:	content								
No.:	of brain								
	per cent	0-10	10-20	20-30	30-40	40-50	50-60	60-70	
1	0.38	+++	++	Trace	None	None	None	None	
2	0.36		++	+	Slight trace	"	"	"	
3	0.4	+++	++	Trace	" "	"	"	"

6	0.55	++++	+++	++	+	+	"	"	
7	0.4	+++	++	Trace	None	None	None	None	

*All determinations on successive 10 cc. portions of distillate from 70 to 100 gave negative results.

Determination of the Best Conditions for Oxidation

"A series of 100 cc. portions of water, each containing 50 mg. of alcohol, was used. Varying amounts of dichromate and sulfuric acid were added. On distilling, it was possible to obtain 80 cc. of distillate, no trace of sulfur trioxide passing into the distillate. The acetic acid in the distillate, produced by oxidation of the alcohol, was titrated. The results are given in Table II.

"The optimum amount of oxidizing mixture for 100 cc. of alcohol solution (containing in the neighborhood of 50 mg. of alcohol) is 7.5 gm. of potassium dichromate and 15 cc. of concentrated sulfuric acid.

Method in Detail for the Quantitative Estimation of Ethyl
Alcohol in Blood and Spinal Fluid

"10 cc. of the fluid and 1 gm. of paraffin are placed in a 100 cc. distillation flask which is then set up for steam distillation. The flask containing the blood or spinal fluid is not heated. The steam alone is used for the distillation. 100 cc. of distillate are collected. To these 100 cc. of distillate, placed in a 200 cc. round bottom flask, are added 7.5 gm. of potassium dichromate and 15 cc. of concentrated sulfuric acid. The flask is connected to a long, well cooled condenser by means of a Hopkins distilling head. The contents are well mixed. A medium sized

(1½ inch) Bunsen flame is applied, so that the distillation is not too rapid. The distillation should be at a slow but constant rate. It should take about 60 minutes to collect the required 80 cc. of distillate. When

TABLE II
Best Conditions for Oxidation of Solutions containing
50 Mg. of Added C₂H₅OH

K ₂ Cr ₂ O ₇ in oxidiz- ing mixture	H ₂ SO ₄ in oxidiz- ing mixture	0.05 N acetic acid: in distillate	C ₂ H ₅ OH recovered
gm.	cc.	cc.	mg. : per cent
5.5	11	18.95	43.6 : 87.2
6.5	13	19.00	43.7 : 87.4
7.5	15	19.80	45.5 : 91.0
8.5	17	19.25	44.2 : 88.4
10.0	20	18.90	43.4 : 86.8

exactly 80 cc. have been collected, the distillate is well mixed and aliquot portions are titrated with 0.05 N sodium hydroxide for acetic acid produced. A small part of this distillate should be tested for the sulfate ion, in order to be sure that no sulfur trioxide passed into the distillate. If the above procedure is followed, there should be absolutely no danger of sulfur trioxide distilling. From the amount of acetic acid found by titration, the amount of ethyl alcohol is calculated.

Acidity Produced by Oxidation of the Distillate from Non-Alcoholic Spinal Fluid

"It was essential to determine whether the spinal fluid of individuals who have had absolutely no alcohol will give a distillate which will yield acidity upon oxidation. Spinal fluid samples from ten cases were analyzed according to the method outlined above. The patients having

TABLE III

Acidity Produced by Oxidation of Spinal Fluid Distillate from Non-Alcoholic Individuals

10 cc. of spinal fluid were used for each analysis.

been in the hospital under observation, we were positive that they had not had any alcohol for at least a fortnight prior to the removal of the spinal fluid. The results of the analyses are given in Table III.

"The figures in Table III indicate that non-alcoholic spinal fluid yields certain volatile substances to the distillate, which, when oxidized in accordance with our method, yield on the average for every 10 cc. of spinal fluid an acidity of 0.78 cc. 0.02 N. This is equivalent to 0.0071 per cent of ethyl alcohol, or 0.71 mg. of ethyl alcohol in every 10 cc. of spinal fluid. Whether this is actually ethyl alcohol one cannot definitely state. The amount present is too small to be identified. We simply claim that it is acidity produced by the oxidation of some normal volatile substances.

Acidity Produced by Oxidation of the Blood Distillate from Non-Alcoholic Individuals

"In order to determine whether distillates from blood, upon oxidation by our method, yield any acidity, the following experiment was conducted.

"Specimens of blood from fourteen cases were analyzed according to our method. The fourteen patients were under observation in the hospital and had partaken of no alcohol for at least a fortnight prior to the drawing of the blood. The results are shown in Table IV.

"The experiments given in Table IV indicate that non-alcoholic bloods yield certain volatile substances to the distillate, which, when oxidized by our method, yield on an average for every 10 cc. of blood an

acidity of 1.33 cc. 0.02 N, equivalent to 0.012 per cent of ethyl alcohol, or 1.2 mg. of ethyl alcohol in 10 cc. of blood. We do not assert at present that this is ethyl alcohol; it is some volatile material found in normal blood which, upon oxidation, yields titratable acidity.

"Table III indicates that from 10 cc. of non-alcoholic spinal fluid an average acidity of 0.78 cc. 0.02 N is produced. Table IV shows that from 10 cc. of non-alcoholic blood an average of 1.53 0.02 N acidity is produced. These values must be subtracted from all titration figures when the amount of alcohol present in blood or spinal fluid is calculated. In blood and spinal fluid of alcoholics, we titrated the acidity produced with 0.05 N alkali; therefore, the values to be subtracted are 0.31 cc. 0.05 N for spinal fluid and 0.53 cc. 0.05 N for blood. Although there is a difference of 0.22 cc. 0.05 N between these two values, yet in contrast with the much larger values obtained from alcoholic blood and spinal fluid (15 to 20 cc. 0.05 N), the above difference of 0.22 cc. 0.05 N is negligible. For this reason we averaged the values obtained in spinal fluid (0.31 cc. 0.05 N) and in blood (0.53 cc. 0.05 N) and obtained the value

TABLE V

Recovery of Alcohol from Spinal Fluid and Blood

50 mg. of alcohol were added to each specimen.						
Sample No.:	Specimen	0.05 N acidity:	0.05 N acidity:

8	" "	18.93	18.51	42.57	85.14	
Average recovery				42.56	85.12	

0.42 cc. 0.05 N. This value we subtracted from all alcohol determinations in blood and spinal fluid.

Amount of Alcohol Recoverable from Spinal Fluid and Blood

"The object of this experiment was to determine how much of added alcohol could be recovered from blood and spinal fluid. 10 cc. portions of non-alcoholic spinal fluid and blood were used. 50 mg. of absolute alcohol were added to each portion. The procedure of analysis was as outlined above. The results are tabulated in Table V.

"As a result of this series of experiments, we find that the optimum average recovery of alcohol from blood and spinal fluid to which known quantities of alcohol were added is 85 per cent.

Calculation--From the titration figures, the amount of alcohol in spinal fluid is calculated as follows:

Per cent alcohol = $(\text{cc. 0.05 N alkali used} - 0.42) \times \frac{100}{85} \times 0.0023 \times 10$ in which
 0.42 is the blank control; $\frac{100}{85}$, the factor based on 85 per cent recovery;
 0.0023, the gm. of alcohol equivalent to 1 cc. (0.05 N); and the multiple
 10 is used to get the amount in 100 cc. from the 10 cc. used.

Alcohol Content of Brain, Blood, and Spinal Fluid

"The alcohol content of the brain, blood, and spinal fluid in a series of cases was determined by the method previously outlined. The results are given in Table VI.

TABLE VI

16	0.580*	0.460	0.80	0.645	1.11	Seen in coma; then died

*Intoxicated

"Gettler and Tiber (2) have shown that the alcohol content of the brain can be used to prove intoxication. We, therefore, used the figures obtained from the brain as the basis of our blood:brain ratio and spinal fluid:brain ratio. A comparative study of the figures in Table VI shows the following:

1. The alcoholic content of the spinal fluid is always higher than that of the brain.

2. The smaller the alcohol content of the brain, the larger is the spinal fluid:brain ratio. The larger the amount of alcohol in the brain, the nearer do the spinal fluid values approach the values in the brain, the spinal fluid:brain ratio approaching a value of 1.1.

3. The spinal fluid:brain ratio in intoxicated individuals is below 1.4 (it ranges between 1.4 and 1.1).

4. The spinal fluid:brain ratio in individuals who have partaken of some alcohol, but in whom the amount accumulated in the brain is too small to cause intoxication, is above 1.5 (it may go as high as 3).

5. The alcohol content of the blood varies greatly. In some of our cases it was higher than that of the brain and in other cases it was lower.

6. The blood:brain ratios range anywhere from 0.66 to 4.55. There is no regularity as in the case of the spinal fluid:brain ratio. This variation evidently depends upon the stage of absorption at which death intervenes.

"From the facts determined above, we claim that the spinal fluid, but not the blood, can be used for estimating the amount of alcohol in the brain of a living individual. The alcohol content of the brain and that of the spinal fluid run quite parallel. Since the alcohol content of the brain is an index of intoxication, the spinal fluid can be used to prove intoxication in living individuals.

"The spinal fluid:brain ratios being used, we suggest that the following procedure be used for estimating the amount of alcohol in the brain of a living individual.

For alcohol content of spinal fluid (0.03-0.10 per cent)
divide by 2.5

For alcohol content of spinal fluid (0.15-0.20 per cent)
divide by 1.5

For alcohol content of spinal fluid (0.25-0.50 per cent)
divide by 1.2

For alcohol content of spinal fluid (0.50-0.70 per cent)
divide by 1.1

Alcohol Content of Blood and Spinal Fluid of Hospital Patients

"The alcohol content of the blood and spinal fluid in a series of sixteen hospital cases was determined, the methods previously outlined being used. The results are given in Table II. The values obtained indicate the following:

1. All cases having 0.272 per cent or more alcohol in the spinal

TABLE VII

7	: 0.354	: 0.353	: 1.00	: "
8	: 0.431	: 1.032	: 2.39	: "
9	: 0.438	: 0.250	: 0.57	: "
10	: 0.443	: 0.405	: 0.91	: "
11	: 0.447	: 0.227	: 0.51	: "
12	: 0.538	: 0.416	: 0.77	: Coma
13	: 0.657	: 0.351	: 0.53	: "
14	: 0.696	: 0.251	: 0.36	: "
15	: 0.741	: 0.511	: 0.69	: "

fluid were intoxicated. This corroborates the findings of Gettler and Tiber (2) that all individuals with an alcohol content of over 0.25 per cent in the brain are intoxicated. All those cases in which the alcohol content of the brain was below 0.2 per cent were not intoxicated. Gettler and Tiber (2) found that some cases in which the alcohol content of the brain was between 0.2 per cent and 0.25 per cent showed slight disturbance in equilibrium, while others did not. Through an oversight, however, this finding was not pointed out in their original paper and we, therefore, call attention to it at this time.

2. The alcoholic blood values are very irregular. The blood: spinal fluid ratio varies from 0.08 to 3.39.

3. The alcohol content of the spinal fluid (but not the blood) can be used as an index of intoxication. Individuals having 0.272 per cent of alcohol or more in the spinal fluid can be safely regarded as intoxicated.

SUMMARY

1. A quantitative method for ethyl alcohol determination in blood and spinal fluid is described. The alcohol is isolated by steam distillation. It is quantitatively estimated by oxidizing it to acetic acid and titrating the acid thus produced.

2. By the use of this method, the alcohol content of blood and spinal fluid of alcoholic hospital patients and also of alcoholics who

had been autopsied was determined. In the latter group the brain also was analyzed for alcohol.

3. The alcohol content of the spinal fluid is always somewhat higher than that of the brain. There is, however, a definite and regular relation between the alcohol content of the brain and spinal fluid.

4. The alcohol content of the blood varies greatly when compared with that of the brain. It may be higher or it may be lower than the alcohol content of the brain.

5. From the values obtained by analysis, the blood:brain and spinal fluid:brain alcoholic ratios were calculated.

6. The smaller the alcohol content of the brain, the larger is the spinal fluid:brain ratio, reaching a value of 2.85. The larger the amount of alcohol in the brain, the nearer do the spinal fluid values approach the values in the brain, the spinal fluid:brain ratio approaching a value of 1.1.

7. The spinal fluid:brain ratio in intoxicated individuals is below 1.4 (it ranges between 1.4 and 1.1).

8. The spinal fluid:brain ratio in individuals who have partaken of some alcohol, but where the amount accumulated in the brain is small and, therefore, not enough to cause intoxication, is above 1.4 and may run as high as 3.

9. The blood:brain ratios vary anywhere between 0.66 and 4.55. There is no regularity in the blood:brain ratios as there is in the spinal fluid:brain ratios.

10. All cases having 0.265 per cent or more alcohol in the spinal fluid were intoxicated. This corroborates the findings of Gettler and Tiber that individuals with an alcohol content in the brain of over 0.25 per cent are intoxicated.

11. A method is suggested for estimating the alcohol content of the brain of a living individual from the alcohol content determined in the spinal fluid. Dividing the alcohol content of the spinal fluid by the spinal fluid:brain ratio, we obtain a close estimate of the alcohol content of the brain.

12. The alcohol content (0.265 per cent and higher) of the spinal fluid of living persons is an index of intoxication.

"We wish to acknowledge our appreciation of the courtesy of Dr. Alexander Lambert, Director of the Fourth Medical Division of Bellevue Hospital, in permitting us to use the clinical material from his service."

RIGHT THUMB - WILLIAM SCHMITT

RIGHT THUMB - HARLEY FAIT

SO-CALLED IDENTICAL FINGERPRINTS NOT IDENTICAL

The press in many sections of the country has recently issued a story concerning an individual known as William Schmitt, who was arrested by the Police Department at Walla Walla, Washington. According to the story, which was featured in many of the daily papers, it required twelve fingerprint experts "going into subclassifications to determine that his fingerprints were really different" from those of Harley Fait, who had been an escaped convict from the Idaho State Penitentiary, Boise, Idaho, since July 30, 1930. Since it is difficult to understand how fingerprint experts would encounter difficulty in making the comparison between the finger impressions of these two individuals, there is being reproduced on the preceding page the rolled impressions of the right thumb of each of these subjects.

On examining these two impressions, even a person who has had no experience in examining finger impressions can readily determine the lack of identity between them. It will be noted in the right thumb print of Harley Fait that only eighteen ridges can be counted between the delta and the core, while in that of William Schmitt there are twenty-four such ridges. Thus in the very first pattern which we examine in the set of ten impressions of each individual we find a decided variance. This variance in the ridge count should make it unnecessary to examine the finer details of each pattern and it requires but a casual inspection of these fingerprints to notice that such characteristics as small bifurcations, ending ridges, et cetera, cannot be found to occur in these two patterns in the same relative positions. The delta and the core of each pattern are decidedly different and are in no way similar. The fingerprint classifications of these two subjects are as follows:

William Schmitt	24	L	1	R	I00	MM	13
		L	1	R	I00	ML	
Harley Fait	17	S	1	R	I00	11	Ref: M
		L	1	R	I00		L

It is believed that the twelve so-called "experts" encountered difficulty in determining the lack of identity between these two subjects merely because of the fact that they were not trained to look beyond the classification formula. As you will note the primary, secondary and sub-secondary classifications are similar, but even there the likeness ends, since the major division, the final and the key in each of the instances differ materially. It is believed that each identification officer will desire to keep this material at hand in order to refute any effort to discredit the fingerprint science based upon the difficulty of these twelve "experts" who found it necessary to go into the "finer ramifications" of the fingerprint science to determine that Schmitt's fingerprints really differed from those of Harley Fait, the escaped Idaho convict.

A QUESTIONABLE PATTERN

The pattern which is submitted for discussion in this month's FBI Law Enforcement Bulletin is one the interpretation of which has caused considerable difficulty among identification officers for some time. The pattern is a transitional type, which should be given the questionable classification of either a "tented arch" or a "loop". If it is determined that this pattern should be given the preferential classification of a loop there must be present, of course, the three essential elements of a loop type pattern, namely, the delta, the core and at least one looping ridge. Therefore, these three essentials must be located before a loop classification can be given. Of course, if one of these is absent the tented arch classification must be applied.

Close inspection of the pattern indicates two type lines which have been marked "T". It will be noted that these ridges flow in a parallel direction diverging near the point "D". Our delta is then closed at point "D" by the bifurcation of the ridge which we find midway between the two type lines. For the looping ridge look to the ridge which is marked from "L-1" around to "L-2". Of course, between these two points indicated there are two ridges which join this looping ridge flowing out of the delta. Some

identification officers would consider this sufficient to classify this pattern as a tented arch. However, in the Identification Division of the FBI the so-called predominating ridge rule is applied. Such a rule provides that if the looping ridge is the predominating ridge then the loop classification shall be applied, providing the other elements are present. The last element of the loop is, of course, the ridge count and there must be located the core. In this particular pattern the core should be located at point "C", since at that point there terminates a rod in the center of the looping ridge. Parallel to the ridge terminating at point "C" will be found another ridge or rod which terminates at point "R". The rule is clearly established that when two such rods occur the core is located at the termination of the rod which is located the farthest from the delta. When our imaginary line, therefore, is constructed from the delta to the core we find that it runs along the short ridge, running up from point "D" and meeting the looping ridge and thus preventing a ridge count at that point. However, one ridge count is obtained when our imaginary line intersects the rod which is mentioned above as ending at point "R". Thus we find the three essential parts of the loop are present in this pattern and the loop classification is, therefore, preferred in this instance. However, as pointed out in the conclusion of the article on the questionable pattern which was printed in last month's issue of the Bulletin, such transitional patterns as this by all means should be given a reference classification as well and in the Identification Division of the Federal Bureau of Investigation, while this print would be searched first as a loop containing one ridge count, it would next be searched as a tented arch.

For further discussion of the interpretation you are referred to pages 17 to 22 inclusive of the Bureau pamphlet entitled "Classification of Fingerprints".

* * * * *

RECORDING PERSONAL DATA ON FINGERPRINT CARDS

The Federal Bureau of Investigation periodically prepares tabulations concerning the age, sex, race, nativity, and previous criminal history of persons arrested and fingerprinted. These compilations are based upon the fingerprint records received from individual law enforcement agencies throughout the United States. It will be apparent, therefore, that it is highly desirable that agencies taking finger impressions exercise care to record complete and accurate personal information concerning the individual arrested, as provided on the fingerprint card. It is particularly desirable that information be recorded as to the place of birth of the persons represented. With reference to foreign-born persons, if it is made known at the time of arrest that they are aliens, this fact should also be noted on the cards. This will constitute a valuable part of the criminal record and will be of interest to other participating agencies. In addition, it will contribute to the statistical tabulations relative to the personal characteristics of persons arrested throughout the United States, which have received widespread attention and comment.

SKELETON IDENTIFIED BY FINGERPRINTS

The letter reproduced on the following page together with the photograph below, was received in the Bureau and is being set out in the Bulletin for the attention of interested law enforcement officers.

The letter is explanatory of the case. It will be noted in the left corner of the photograph that the fingernails of the right hand are noticeably intact, despite the right arm having become detached from the skeleton.

This case illustrates exceptionally well what can be done with fingerprints in the identification of unknown dead. It emphasizes, also, that although conditions are unfavorable, that the condition of the deceased's fingerprints may at first glance appear to be hopelessly deteriorated, rejuvenation may be had with proper handling. By making use of known methods of rejuvenation, a set of impressions may be obtained which will readily lend themselves to effective identification.

UNITED STATES
DEPARTMENT OF THE INTERIOR
NATIONAL PARK SERVICE

Yosemite National Park, California.
March 14, 1936.

Mr. J. Edgar Hoover, Director,
Federal Bureau of Investigation,
U. S. Department of Justice,
Washington, D. C.

Dear Sir:

"I am enclosing herewith a short narrative and a snapshot that might be of interest for your FBI Bulletin.

"The skeleton was found outside and in back of a cabin in the high Sierras of Yosemite National Park, California, on June 11, 1935. Death was due to starvation.

"Although this body had lain for over five months exposed to animals and the elements, there remained sufficient flesh on the hands to obtain finger prints and the final identification of the man.

"Through the close co-operation of the funeral directors that handled the remains, prints were obtained by making a number of surgical operations and a good soaking of the hands in a strong caustic solution as was outlined in an early issue of the FBI.

"From clothing on the body it was identified by Rangers as Karl Meyers, an itinerant from the Sonora region, whom they had warned to leave the Park for causing a disturbance in October, 1934.

"Notes found in the cabin showed that the man had arrived at this point on November 25, 1934, with very little food. He remained for several weeks till he became snowbound and slowly starved to death. His last note was dated January 4, 1935, and was signed K. A. B. He evidently died soon after this.

"His prints were identified by the FBI as Karl A. Bentel, alias Otto Miller, a communist who was in the country illegally. Among his effects was a 'Red flag' with the crossed hammer and scycle."

Respectfully submitted,

(Signed) W. K. Merrill,
U. S. Park Ranger.

ROY WORKMAN MAKES FINAL ESCAPE

The Police Department at Tampa, Florida, on March 22, 1936, made telegraphic inquiry of the Bureau regarding one Richard S. Wayne, whose fingerprint classification was set forth in the telegram. From a search of the files of the Identification Division Wayne was tentatively identified as Roy Workman, who, during his criminal career, had used the alias of R. C. Wayne. The record of Workman was furnished the Police Department at Tampa, Florida, in response to the request from that Department.

The record disclosed that Workman, as Roy Workman, had been received at the State Reformatory, Green Bay, Wisconsin, on December 24, 1909, to serve a sentence of three years for the crime of robbery from the person. The Police Department at Long Beach, California, arrested him on March 29, 1913, as Roy Workman, on a charge of grand larceny - theft of a motorcycle. He subsequently escaped from jail, but was recaptured and turned over to the Federal authorities. As Roy Workman, he was received at the State Prison, San Quentin, California, on November 19, 1913, to serve a sentence of six years for violation of Section 46 of the Federal Penal Code of 1910.

The Police Department at Long Beach, California, again arrested him as Roy S. Workman, on January 6, 1919, charged with being a fugitive from Los Angeles, California. He was again received under the same name at the State Prison, San Quentin, California, on June 26, 1919, to serve a sentence of from 1 to 10 years for the crime of grand larceny. He was transferred to Folsom Prison, Represa, California, on July 5, 1919.

The Bureau received information on December 9, 1929, from the Sheriff at Martinez, California, that Workman was wanted for rape and escape. On March 19, 1930, the Sheriff at Columbia, Mississippi, arrested Workman under the name of Robert Harvey on a charge of petty larceny. A fingerprint card was received from the Police Department at St. Louis, Missouri, on April 7, 1930, reflecting the finger impressions of Workman who was being held for safe-keeping while en route to Martinez, California. A notation appearing on this fingerprint card indicated that Workman had been arrested at Bisbee, Arizona, on April 15, 1926, but escaped before officers arrived with extradition papers.

The wanted circular issued by the Sheriff of Contra Costa County, Martinez, California, described Workman as a salesman and an exceptionally slick article, who had been apprehended several times and escaped each time. The circular indicated that Workman would do anything to make his escape possible. After his arrest by the Sheriff at Columbia, Mississippi, Workman was safely returned to the State Prison, San Quentin, California, on April 7, 1930, and was transferred to Folsom Prison, Represa, California, on February 21, 1931. The Sheriff at Lucedale, Mississippi, took Workman into custody on February 14, 1934, on a charge of obtaining goods under false pretenses. When the fingerprints of Workman, as Richard S. Wayne, were received from the Police Department, Tampa, Florida, on March 26, 1936, the card bore the notation that Workman had committed suicide on March 22, 1936, by leaping three stories to his death from a window in the City Jail.

HENRY THOMPSON

FUGITIVE WANTED FOR MURDER IDENTIFIED BY FINGERPRINTS

Law enforcement agencies throughout the country are taking full advantage of the service rendered by the Federal Bureau of Investigation in connection with persons being sought for criminal offenses. Upon receipt of information from a local law enforcement agency that an individual with a known criminal record is wanted, which record is sufficiently identified by an arrest number, an appropriate notation is entered on the record instructing that the interested agency be notified in the event the wanted person is apprehended.

The State Police at Greensburg, Pennsylvania, notified the Bureau on June 21, 1935, that Henry Thompson, previously arrested by that organization on January 22, 1932, on charges of robbery, felonious assault and battery, and sentenced to the State Industrial Reformatory, Huntingdon, Pennsylvania, for a term of five years for the crime of robbery, was wanted on a charge of murder. An appropriate notation was entered on the record of the Bureau to notify the State Police at Greensburg, Pennsylvania, in the event Thompson were apprehended.

On March 27, 1936, a fingerprint card was received from the Police Department, Cleveland, Ohio, reflecting the arrest of one Isaac Leggins on March 24, 1936, charged with auto stealing. When the fingerprints of Leggins were searched through the files of the Identification Division of the Bureau they were found to be identical with those of the Henry Thompson wanted for murder. A telegram was immediately directed to the State Police at Greensburg, Pennsylvania, as well as to the Police Department at Cleveland, Ohio, advising both as to the identification effected by the Bureau's technical experts.
