

F B I

LAW ENFORCEMENT BULLETIN

Joseph Hanley is wanted for the kidnaping of Ernest K. Newman at Sioux City, Iowa, February 4, 1935, for which offense he was indicted by a Federal Grand Jury at Sioux City, Iowa on June 1, 1935. Hanley is also wanted for the kidnaping of Herman G. Bredensteiner and Dean S. James at Nishnabotna, Missouri, on June 3, 1935. A complaint was filed before a United States Commissioner at Omaha, Nebraska June 27, 1935 charging him with this offense. Hanley is the subject of Identification Order #1268, issued by the Federal Bureau of Investigation.

Federal Bureau of Investigation
U. S. Department of Justice

John Edgar Hoover, Director

Washington, D. C.

VOL. 4 NO. 10

OCTOBER 1, 1935

The Federal Bureau of Investigation, U. S. Department of Justice, is charged with the duty of investigating violations of the laws of the United States and collecting evidence in cases in which the United States is or may be a party in interest.

The following list indicates some of the major violations over which the Bureau has investigative jurisdiction:-

National Motor Vehicle Theft Act
Interstate transportation of stolen property valued at \$5,000 or more
National Bankruptcy Act
Interstate flight to avoid prosecution or testifying in certain cases
White Slave Traffic Act
Impersonation of Government Officials
Larceny of Goods in Interstate Commerce
Killing or Assaulting Federal Officer
Cases involving transportation in interstate or foreign commerce of any persons who have been kidnaped
Extortion cases in which interstate commerce or interstate communication is an element
Theft, Embezzlement or Illegal Possession of Government Property
Antitrust Laws
Robbery of National Banks and Member Banks of Federal Reserve System
National Bank and Federal Reserve Act Violations, such as embezzlement, abstraction or misapplication of funds
Crimes on any kind of Government reservation, including Indian Reservations or in any Government building or other Government property
Neutrality violations, including the shipment of arms to friendly nations
Frauds against the Government
Crimes in connection with Federal Penal and Correctional Institutions
Perjury, embezzlement, or bribery in connection with Federal Statutes or officials
Crimes on the high seas
Federal Anti-Racketeering Statute
The location of persons who are fugitives from justice by reason of violations of the Federal Laws over which the Bureau has jurisdiction, of escaped Federal prisoners, and parole and probation violators.

The Bureau does not have investigative jurisdiction over the violations of Counterfeiting, Narcotic, Customs, Immigration, or Postal Laws.

Law enforcement officials possessing information concerning violations over which the Bureau has investigative jurisdiction are requested to promptly forward the same to the Special Agent in Charge of the nearest field office of the Federal Bureau of Investigation, U. S. Department of Justice. The address of each field office of this Bureau appears on the inside back cover of this bulletin. Government Rate Collect telegrams or telephone calls will be accepted if information indicates that immediate action is necessary.

The F. B. I. LAW ENFORCEMENT BULLETIN is published by the Federal Bureau of Investigation, United States Department of Justice each month. Its material is compiled for the assistance of all Law Enforcement Officials and is a current catalogue of continuous reference for the Law Enforcement Officers of the Nation.

**John Edgar Hoover, Director
Federal Bureau of Investigation
U. S. Department of Justice
Washington, D. C.**

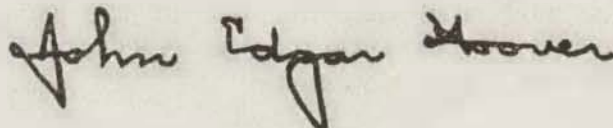

The Federal Bureau of Investigation has always welcomed every opportunity to assist law enforcement officials and to encourage a comprehensive and enthusiastic cooperation among those engaged in combating crime.

Many facilities of the FBI have been made available to law enforcement agencies throughout the country; the assistance offered by the Identification Division, the Technical Laboratory, and through the preparation of crime statistics are well known.

The FBI has published, each month, the Fugitives Wanted by Police Bulletin, in which has appeared information concerning fugitives and articles pertaining to scientific crime detection or matters which might otherwise be of interest and assistance to the peace officer. Believing that the FBI can be of further aid to the law enforcement officer, the scope of the Fugitive Bulletin is being broadened to provide, not only a means of making nationally known the fugitives wanted by law enforcement agencies, but a national periodical of interest and value in the field of law enforcement.

In keeping with the extension of content, the name of the Fugitives Wanted by Police Bulletin has been changed, with this issue, to the FBI Law Enforcement Bulletin. It is intended that this publication should provide a clearing house for police officials regarding successful police methods, a medium for the dissemination of important police information, and a comprehensive literature pertaining to the scientific methods in crime detection and criminal apprehension.

It is hoped that the FBI Law Enforcement Bulletin will serve in making available, to law enforcement officers everywhere, subject matter of interest to them and of aid to progressive law enforcement.

A handwritten signature in dark ink, reading "John Edgar Hoover". The signature is written in a cursive, flowing style with a large initial "J".

Director.

MISSING PERSONS

The Federal Bureau of Investigation has no jurisdiction under existing legislation to conduct investigations for the purpose of locating missing persons unless their apprehension is being sought for the violation of a Federal Statute concerning which the Bureau has investigative jurisdiction, or in which the location of a person is desired as a witness in connection with prosecution for violating of such a Statute. Frequent requests are received for investigation by this Bureau to locate individuals on behalf of relatives or friends where no violation of a Federal law is involved. For the information of all law enforcement agencies, attention is called to the fact that, while the Federal Bureau of Investigation can conduct no investigation to locate such persons, it will, at the request of law enforcement agencies, relatives or guardians, post in the files of the Identification Division of the Bureau a missing person notice containing descriptive data including, when possible, fingerprints and photograph of a missing person and in the event information is received indicating the whereabouts of the individual, the persons or agencies placing a request for such a wanted notice will be immediately advised.

SPECIAL ANNOUNCEMENT

Recently many fingerprint cards have been received in the Bureau's Identification Division which do not contain the title and address of the contributing officials, that is, the law enforcement agency forwarding the prints. It is suggested that extreme care be exercised in the proper marking of all fingerprint cards in order that replies thereto may be forwarded to the proper agency. It is also suggested that the name of the person whose fingerprints are submitted be printed or typewritten on the fingerprint cards in order to enable the said name to be read properly.

INSTALLATION OF A SINGLE FINGERPRINT FILE

FEDERAL BUREAU OF INVESTIGATION

During recent years considerable attention has been given by identification officers throughout the world to the study of classifying and filing single fingerprints. This branch of the science of fingerprinting differs from the identification systems of Henry, Vucetich, and others in that each finger of the hands is given separate treatment and a classification attained for each digit through an analysis of the ridge formations appearing therein. After its classification, the impression of each finger (mounted or recorded on separate cards) is filed separately, and it is thus unnecessary to have all the fingerprints of both hands to effect a subsequent identification.

The primary object, of course, of such a system is to file criminal fingerprints in such a manner that accidental or latent fingerprints such as may be found at the scene of a crime may be searched against the file in an effort to identify them. Incidentally, the development of the single fingerprint system tends to provide information which is frequently needed for the further extension and subdivision of fingerprints comprising a large collection under the Henry System. To this extent any single fingerprint bureau may be regarded as a laboratory for further consideration of the more minute and involved application of the fingerprint classification system.

In February, 1933, the Federal Bureau of Investigation installed a single fingerprint system. Due to the voluminous fingerprint file now in existence in the Bureau, where the fingerprints of more than 3,000 criminals are received daily, it became necessary to confine this study to the fingerprints of a certain limited class or classes of criminals in order that the single fingerprint file thus developed might be most comprehensive without becoming too large while in its constructive stages. After consideration, known gangsters and persons charged with the crimes of bank robbery, kidnaping, and extortion were selected as being of sufficient general interest to serve a practical purpose and yet prevent the file from growing too rapidly while in the experimental stage. In these fields of crime recently entered by gangsters and their ilk, latent fingerprints often will be found to be quite prevalent, on extortion letters, at the scene of the crime, upon the abandoned automobile, at the rendezvous where the victim was held if it be subsequently located, etc. On July 31, 1935, this file contained the single fingerprints of 11,424 individuals whose names have been connected at some time in the past with bank robberies, racketeering, kidnaping, or extortion. This constitutes a total of 114,240 single fingerprints which have already been classified and individually filed under the system.

Heretofore it has not been possible for the Federal Bureau of Investigation to receive latent fingerprints for comparison or search in its files unless the names of suspects whose fingerprints are available or already on record in the Bureau's files, were furnished. The main fingerprint files of the Bureau contained on July 31, 1935, 5,078,566 fingerprint cards and it would, of course, be impracticable to attempt to examine the majority of these cards, classified and filed under the Henry System, in order to attempt to find a finger impression identical with a single latent print.

With the installation of a single fingerprint file it is now possible for the Bureau to receive for search through this file latent fingerprints found at the scene of a crime, particularly when such crime is of a bank robbery, kidnaping or extortion nature, and the Bureau invites the contribution for search through this file of such latent finger impressions. When such prints are submitted it is preferred, if possible, that they be positive photographs reproducing the latent prints in their actual size and accompanied by a brief description of the nature of the surface upon which latent prints were found, color of the background, and information regarding the nature of the powders or chemicals which may have been used in the development of the latent prints. Such latent fingerprints will be searched through the single fingerprint files, and if not identified but susceptible of classification they will be filed in the Bureau for possible future identification as new criminal suspects are added to the file. If the crime is not one of bank robbery, kidnaping, or extortion the Bureau will be pleased to receive latent fingerprints in connection therewith, provided the names or fingerprints of suspects are furnished in order that the latent impressions may be compared with the fingerprints of such suspects.

Law enforcement officials who from their files can furnish names of gangsters or individuals who in the past have been associated with crimes of bank robbery, kidnaping, and extortion are urged to submit to the Bureau for entry in its single fingerprint file the names, arrest or commitment numbers, and fingerprint classifications of those individuals, in order that the Bureau's file may be maintained as comprehensively as possible, on a truly national scope.

There is also maintained in connection with the Single Fingerprint Section a bank robbery modus operandi file wherein is filed information concerning the mode of operation employed in the robbery of banking institutions.

YOUR SIDEARM

Keep your gun perfectly cleaned and oiled. Inspect its mechanism frequently to see that it is in serviceable condition. Make certain that your weapon is instantly available for use.

THE DIPHENYLAMINE TEST FOR GUNPOWDER

In view of the current widespread use of the diphenylamine test for gunpowder, this article has been prepared in order to set out for the information of law enforcement agencies the experience of the Technical Laboratory of the Federal Bureau of Investigation with respect to such tests. In recent years, considerable publicity has been given to chemical tests used by law enforcement officials in homicide cases for the purpose of determining whether a deceased person was the victim of a murder or a suicide. The usual method has been the diphenylamine test. In this test the hands of the deceased person are coated with melted paraffin which upon cooling is peeled from the hands, the theory being that the paraffin will adhere to any particles of gunpowder which might have been blown back on the hand from the weapon, if it was in fact fired by the deceased. The surface of the paraffin which touched the hand would then be treated with a solution containing diphenylamine and sulphuric acid. If gunpowder was present on the wax, its presence would be shown by the appearance of specks of a distinct blue color, the normal reaction for nitrates.

The theory of the test is that the nitrate contained in gunpowder forms oxides of nitrogen at the time of the explosion which become embedded in the pores of the skin, particularly on parts of the hand exposed to the escape of gases from the gun. It also unites with the salts of the perspiration to form salts which readily react with the reagents used.

At the outset it should be understood that when this test is used and a positive reaction takes place, that is, specks of a blue color are found in the paraffin, the only conclusion that can be drawn is that some nitrate was present on the hand. In the case of a deceased person, whose hand gives a positive reaction to the diphenylamine test, it should be remembered that the deceased may have had on his hand one of a large number of substances with a nitrate content other than gunpowder. Substances which give the positive reaction include:

- Ammonium nitrate
- Ammonium molybdate
- Mercuric nitrate
- Potassium nitrate
- Potassium nitrite
- Silver nitrate
- Sodium nitrate
- Sodium nitrite
- Uranium nitrate
- Urine
- Nitric acid

From this statement, one might expect to obtain positive reactions from the hands of miners who handle explosives, farmers or home gardeners using fertilizers, employees of nitrate, fertilizer, and fireworks plants, and in some instances chemists or pharmacologists. These facts should be kept in mind in order that a false conclusion that the deceased fired the weapon may be avoided. Such a false conclusion would, of course, indicate a suicide in a case which might actually be one of murder.

On the other hand, it is well to know the limitations of the diphenylamine test which are due to the fact that in a great many instances one may fire a revolver or pistol without leaving any trace of gunpowder on the hand which may be detected by this test. The automatic pistol, of course, is almost completely enclosed and practically all powder particles are forced away from the hand of the person firing the weapon. The revolver has considerable space between the chamber and the barrel which permits a greater quantity of gas and other products of the explosion to be freed near the hand of the person firing the gun. With the revolver, therefore, one would expect to find larger deposits about the thumb and forefinger. In spite of this possible escape of gas and powder particles, numerous tests have indicated that a person may be found to give a negative reaction to the diphenylamine test even though he has fired as many as forty rounds of ammunition. Consequently the mere failure to find a trace of gunpowder by the diphenylamine test on the hand of a deceased person does not prove that he did not fire the weapon causing his death.

It should also be borne in mind that the finding of actual traces of gunpowder on the hands of a deceased person does not conclusively determine that he fired the weapon in question. It is possible that the gunpowder particles may have been blown on the hand directly from the barrel of the gun being fired at the victim. An attempt to shield the body by raising the hand would in some instances result in the implanting of powder particles on the hand.

Among the many laboratory tests made of the diphenylamine method, the one described below is illustrative of the usual results. Tests were performed on both the firing and idle hands of seventeen men following a course of five shots with .38 caliber revolvers using smokeless powder. Six of the men, all firing with the right hand, showed negative results when the test was applied to both right and left hands. One man who fired with his left hand showed negative results on both hands. Three of the men who fired with the right hand showed negative results on a test of the right hands, but positive test on the left hands which were not used for firing. One man who showed a negative result on the right hand when firing with that hand gave a doubtful result on the left hand. Two men firing with the right hands showed positive results on the right-hand test and negative results on the left-hand test. Four men showed positive results on both hands when firing with the right hands only.

A number of experiments performed in the Technical Laboratory were directed toward the effect of tobacco residue on the hands of smokers. As a result of these tests, it was found that persons smoking in any considerable amount gave a positive reaction to the diphenylamine test when applied to the fingers and palms. This result would be expected, of course, in view of the presence of nitrates in the products of the combustion of tobacco.

In spite of the obvious impossibility of drawing positive conclusions from the diphenylamine test, when properly conducted and with a full understanding of its merits and limitations, it is of some value in criminal investigations.

The following is a procedure for conducting the test:

Clean paraffin is melted and painted over the hand, particularly the palm and about the thumb and index finger. This is allowed to cool and is then removed by carefully rolling the edges and peeling the paraffin, endeavoring to keep it in one piece. After the wax has been removed from the hand it is placed in a white porcelain dish or china saucer. As a precaution the use of enameled ware or other metal ware is to be avoided because of the action of strong acids on the metal. To test for the presence of nitrates, add a portion of a solution composed of the following:

Diphenylamine 1 gram

Sulphuric acid C.P. (free from nitrates) 100 c.c.

If nitrates are present, a blue color appears on the paraffin.

In order to be sure that the test is being correctly performed, a control test is conducted. The melted wax may be poured over a small area, such as the bottom of a pan or dish and allowed to cool. The test solution is then applied to the upper surface. No color change insures the examiner that the wax itself does not contain nitrates. In performing this test, caution should be taken to avoid any contact between the body or clothing of the person performing the test and the sulphuric acid, inasmuch as such contact would result in severe burns.

No reported cases involving any attempt to introduce evidence concerning the diphenylamine test have come to the attention of the Bureau.

* * * * *

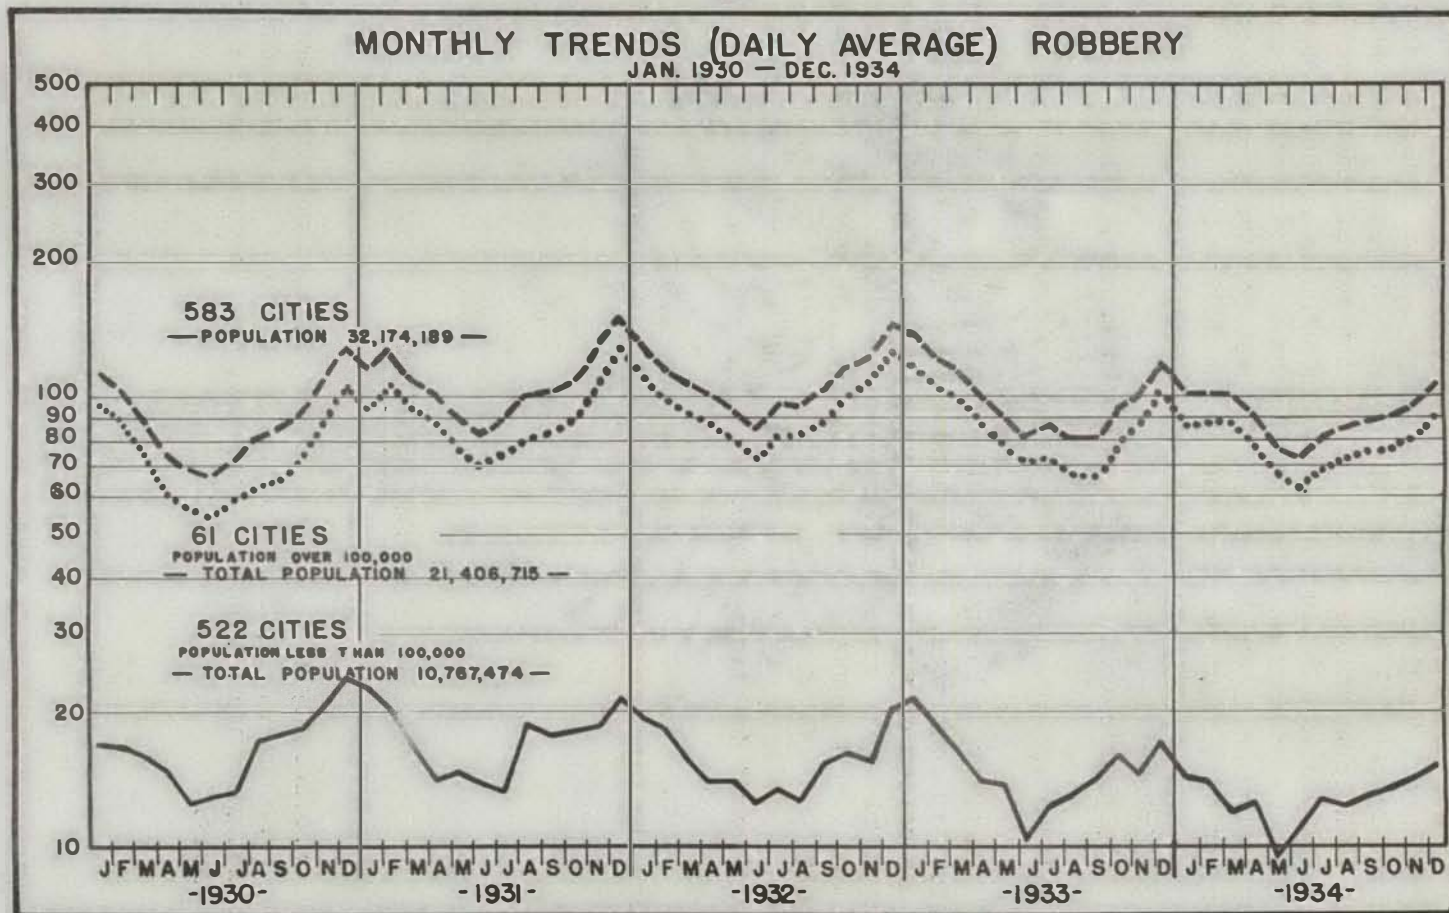

DRY SHOOTING

Proficiency with a revolver is attained only by practice. In the interest of economy, daily dry shooting practice is recommended as a substitute for actual range firing. A good revolver is never harmed by snapping it when empty.

Federal Bureau of Investigation

U. S. Department of Justice

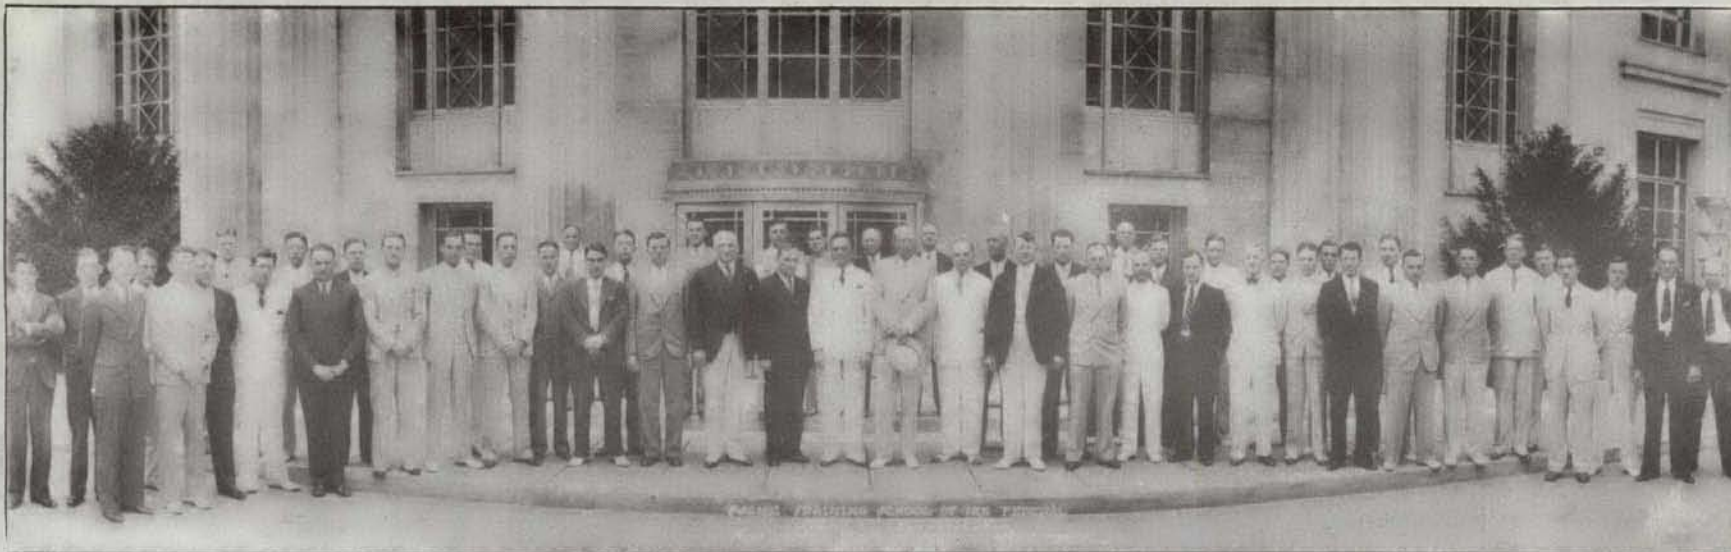

John Edgar Hoover, Director

SEASONAL ROBBERY TRENDS

National police statistics compiled since 1930, under the system of uniform crime reporting, indicate very distinct seasonal trends in the number of offenses of robbery. The lowest number of offenses occurs during the summer months with the high points occurring in the fall and winter. This seasonal variation is quite clearly portrayed in the chart facing this page.

The chart indicates that during October there generally occurs the beginning of a very marked upward trend in the number of robberies committed. Attention is called to this fact at the present time because it is thought possible that something may be done to reduce the number of robberies occurring during the fall and winter months. It is suggested that individual police organizations may find it desirable to examine records for their own communities to ascertain whether local trends follow national trends, as indicated in the above chart. Assuming that they do, the next step would be to make a further study of local records to ascertain the portions of the city in which offenses of robbery tend to occur most frequently. The records may be further examined to determine the time of day when such offenses are most likely to be committed, the types of individuals likely to be involved, and also to disclose further information which may be of assistance in planning preventive measures. In view of all the facts disclosed by a careful study of local records for prior periods, it may be possible to provide for more adequate supervision of certain districts during the times when offenses of robbery are most likely to be committed, and to apply additional preventive measures with the result that there may be a substantial curbing of the upward trend in the robbery curve during the ensuing fall and winter months.

OPENING SESSION OF THE FBI POLICE TRAINING SCHOOL
UNITED STATES DEPARTMENT OF JUSTICE, WASHINGTON, D. C.

In attendance were the Honorable Homer S. Cummings, Attorney General; J. Edgar Hoover, Director of the FBI; Peter J. Siccardi, former president of the International Association Chiefs of Police and Chairman of the Advisory Committee to collaborate with the FBI on police training; John L. Sullivan, Chief of Police, Pittsfield, Massachusetts and Edward J. Kelly, Superintendent of the Rhode Island Police Department, committee members; Hugh H. Clegg, Assistant Director in charge of the Police Training School; the police officers from state, county, and municipal police departments, attendants of the first Police Training School, and a training class of FBI Special Agents.

SCIENTIFIC EVIDENCE

A great number of convictions obtained in criminal cases are a result of thorough, and intelligent assembling of evidence by alert lawenforcement officials. A study of the law will disclose that scientific analyses of evidence in criminal cases has been reviewed in the courts throughout the country with the result that the courts have not only approved of the use of scientific methods in crime detection, but have gradually opened new fields, permitting testimony and evidence of a scientific nature by experts who have made a disinterested, methodical study of the evidence.

Many cases involve a combination of various types of evidence developed in the laboratory and therefore a great variety of applications of scientific principles to crime problems must constantly be borne in the mind of the investigating officer. In this respect much remains to be done on the part of lawenforcement officers who sometimes fail to avail themselves of the scientific aids offered them.

The case of Magnuson vs State 203 N. W. 749, set out below, illustrates very well, the possibilities of applying a variety of scientific principles to a particular case. John Magnuson was tried on a charge of murder for sending a bomb which exploded when the package containing it was opened by the addressee's wife.

"The wrapper on the bomb was somewhat torn and mutilated, but was preserved, identified, and offered in evidence as State's Exhibit A. The word "Marshfield" was misspelled, being written "Marsfilld," the "h" and "e" being omitted. Professor Stromberg of the University of Minnesota testified that this spelling was characteristic of one familiar with the Swedish language as was also the pronunciation "Mars" for "Marsh." This fact led to the supposition that some person of Swedish antecedents had written the address. The only person known to have any existing enmity against Mr. Chapman was the defendant. He was also the only person of Swedish nationality in the district.

"From the pieces picked up about the Chapman home, the bomb was reconstructed and was found to be made of a piece of white elm, about 14 inches long and about an inch and a quarter square, with a hole bored through the center, in which was placed a wagon bolt inside of a spring, which could be compressed by pulling the bolt back. The contrivance was so arranged that when the bolt was pulled back and the spring compressed, it could be held in place by a trigger, which trigger could be secured by tying down one end with a string. Around the bolt and inside of the elm piece was a round brass tube, in which the bolt moved backward and forward. At the end of the square elm piece was a short piece of gas pipe, screwed on to the piece of elm, and connected with another small collar made from a piece of gas pipe. At the end of the bolt was fasten-

ed a small firing pin, and the firing pin was arranged so that, when the bolt was released by cutting the string that held the trigger, the firing pin would strike the cap of the U. M. C. Remington 12 gauge shell. All the paper part of the shell was cut off. In contact with the U. M. C. shell was a detonating cap which was buried in the T. N. T., which filled the gas pipe, so that when the U. M. C. cap was fired, it exploded the detonating cap and the T. N. T.

"Shortly after the explosion, the defendant's premises were inspected and searched with his consent. Pieces of gas pipe, of brass tubing, and other materials were taken from his premises, including a bottle of ink from his home, and sawdust and shavings from his work bench. There was found on the premises of the defendant a complete mechanical equipment for working in wood and iron, including a work bench, pipe wrench, monkey wrench, chisel, punches, planes, a thread cutter, drawing knife, hammer, blowtorch, files, hack saw blades, emery wheel and other tools, and there was found also a box containing T. N. T. and empty T. N. T. wrappers. There was also a lathe in the shop. T. N. T. detonating caps were found on the premises, and No. 12 U. M. C. Remington shells, the same kind that were used in the bomb. A triangular trip or trigger was taken off the gasoline engine of the defendant on account of its resemblance to the trigger found on the bomb. There were also found springs and other miscellaneous articles, and an exploded shell, which exactly corresponded with the shell found in the bomb, was found on the workbench of the defendant.

"After the defendant was arrested, he made, at the request of the officers, several samples of handwriting and printing. He wrote the word "Marshfield" five times, and each time left out the "h" and the "e." He, however, inserted two "l's" instead of one. At a later time he made other samples of his handwriting. This was after the employment of counsel, and after he had seen the original wrapper, and "Marsh" was correctly spelled.

"With these materials in hand, counsel for the state set to work to establish the fact that the defendant was the manufacturer of the bomb and therefore guilty of killing Mrs. Chapman. The handwriting upon the package, together with the admittedly genuine writing of John Magnuson, was submitted to three experts. Working separately they all positively identified the handwriting on the package as the handwriting of the person who wrote the admittedly genuine standards. In this respect their conclusions were undisputed except by the defendant and one W. W. Way, of Milwaukee. A careful perusal of his testimony rather strengthens than disputes the conclusions reached by the three first-named experts. His cross-examination left his testimony in such shape that it rather confirmed than contradicted the testimony of the other experts. His attempt to account for the resemblance between the writing on the wrapper and the admitted writing of Magnuson on the ground of "accidental coincidence" cast great doubt upon his conclusions.

"Under the microscope the writing upon the package showed that it was written with a fountain pen with a round point, similar to the pen of Ethel Magnuson, the daughter of the defendant. The ink used in writing the

wrapper, Exhibit A, gave the same reaction to chemicals as the ink in the pen of Ethel Magnuson. The ink in the Magnuson house did not give the same chemical reaction, but it was discovered that Ethel's pen had been used by a schoolmate who used black ink, and this black ink, combined with the ink which was found in the house, gave the special reaction. An analysis of the glue used to fasten down the string disclosed that it was Le Page's glue. Magnuson had shortly before this time used Le Page's glue in an attempt to repair a fountain pen for his son. Professor Arthur Koehler of the United States Forest Products Laboratory at Madison established the fact that the sawdust taken from the defendant's workbench was of white elm. This would not have been significant had not the defendant denied that he had ever worked on elm wood in his shop in his life. He admitted having worked on oak. Under the microscope it appeared that the sawdust came from hemlock, oak, and white elm. That part of the wooden covering of the bomb which remained was white elm.

"The trigger on the bomb was compared with the trigger taken from the gas engine on the premises of the defendant. These triggers were analyzed by Professor David Fahlberg of the University of Wisconsin. It was established that no two pieces of steel or iron are identical in appearance unless they come from the same piece. When magnified and photomicrographs are taken of the crystals and formation of the metal, the photomicrographs differ very materially in two pieces of steel. The analysis showed that the trigger from the bomb had the identical crystals and formation of that obtained from the trip on the gasoline engine. The crystal grains of the metal were compared, and the metals were etched and photomicrographs taken after the etching. Different pieces of steel were taken at random, and photomicrographs were taken to show how the pieces differ. The surface of the two pieces appeared to be identical. The thickness was the same to one-half part of a thousandth of an inch. The angle of the cut of the two pieces was the same to within one-tenth of a degree. Professor J. H. Mathews of the University of Wisconsin and Professor Fahlberg examined the two pieces of wrought iron which were found. They were found to be of the same size and to have the same photomicrograph. It also appeared that wrought iron is made in batches of 100 pounds. It would be highly improbable that two pieces would have the same appearance unless they were out of the same batch. The two pieces had the same peculiar physical characteristics. They were from $\frac{3}{4}$ inch pipe and each had 14 threads to the inch.

"Two other exhibits were found, Y and O. O came off the bomb, and Exhibit Y was found on defendant's premises in his workshop. Both pieces were threaded on the inside. This threading was not necessary for the construction of the bomb; hence the conclusion that they had been cut from a piece that the maker had on hand. They were also threaded on the outside. The photomicrographs disclosed the identity of these two pieces. Of this the experts were absolutely certain. The identity of the pieces were further established by the fact that they had the same diameter to a thousandth of an inch. The thread on the outside was 14 per inch, which is a standard thread. The thread on the inside was 18 to the inch, which is not a standard thread. The identity of the three pieces of metal found in the bomb and the three pieces of metal found on the defendant's bench is as conclusively established as it is possible to establish a physical fact."

The jury found Magnuson guilty of murder and an appeal was duly taken. Commenting upon the sufficiency of the evidence in affirming the decision of the lower court, the Appellate Court stated:

"We have set out the evidence with greater particularity than would ordinarily be warranted under such circumstances, because it discloses what may be done by a diligent prosecuting officer who has an intelligent comprehension of the things that are necessary to establish guilt in a case of this importance. The guilt of the defendant is as conclusively established as it is possible for it to be. It is scarcely conceivable that any jury could find otherwise than did the jury in this case."

POISONS

A toxicologist, when called upon to undertake an analysis, should be supplied with the fullest information possible. Information that may serve as a guide to a particular poison or class of poison to look for, is especially important, otherwise time and valuable material may be wasted in searching for something, that from the symptoms and the circumstances of the case is not likely to be present.

MODUS OPERANDI OF REVEREND
COURTNEY HETHERINGTON, with aliases.
Wanted by the FBI for White Slave Traf-
fic Act Violations.

REVEREND COURTNEY HETHERINGTON with aliases: Dr. Courtney Hetherington; Rev. Courtney Gouthey; Dr. Courtney Darling; Rev. Dr. Courtenay Darling; J. Wilbur Taylor; Arthur Adolph DeBussey DeBougainville Charles Vincent Maurice Pierrepont; Maurice Pierrepont; Arthur DeBussey Brockville Charles Maurice Vinson Pierpont Courtney Hetherington; Arthur Hetherington; Dr. C. Gouthey; Dr. C. Darling; Dr. Courtenea; Dr. Pierpont.

Photograph taken in September, 1934.

The activities of the individual whose photograph and aliases appear above were first brought to the attention of the Federal Bureau of Investigation, United States Department of Justice, on September 15, 1934, when the Chief of Police at Birmingham, Alabama, notified the Bureau's Birmingham Office of the receipt of a complaint that this man had possibly violated the White Slave Traffic Act.

It appeared that in the fall of 1933 Hetherington professing to be a former doctor from London, England, converted after having been cured of paralysis by religious faith and then holding revivals in Birmingham, met the daughter of a respectable family there at a church to which he came to preach. After marrying the girl in December of that year, he continued his preaching at Birmingham until March of 1934, when, expressing his intention of reverting to the medical profession, he obtained a loan of \$1,000.00 through his father-in-law for the purpose of opening a laboratory for germ culture and analysis, of which he stated the South was sorely in need. He then journeyed to Chicago with his wife, ostensibly to purchase the necessary equipment, and on March 11, 1934, deserted her there. From Chicago he proceeded to Santa Barbara, California, where in April of 1934 he began holding Bible services at the International Church of the Four Square Gospel under the name of Dr. Courtnay Darling, and after a whirlwind courtship he married the pastor of this church on May 8, 1934. During the religious services he frequently discussed his relatives in England, claiming that they were wealthy and stating that if he could obtain the sum of \$2,000.00 with which to travel to England, he would return with \$15,000.00 to be used for the improvement of the church. In response to his appeal one of the women parishioners gave Hetherington \$1,600.00 with which he purchased American Express Travelers Cheques and departed on July 1, 1934, without his wife for Chicago, supposedly en route to England. Needless to state he failed to return.

Hetherington next appeared at Corpus Christi, Texas, in August of 1934 where, while conducting services in a Seventh Day Adventist Church as Rev. Courtney Gouthey, he met a young woman of that city whom he married in San Antonio, Texas on August 27, 1934. Traveling in Hetherington's new Oldsmobile Coupe, the couple visited several of the bride's relatives in Texas and proceeded to Memphis, Tennessee, where on September 26, 1934, he hurriedly deserted her, leaving his baggage behind, when he heard that the Memphis Police were making inquiries regarding him.

The transportation of this woman from San Antonio, Texas, to Memphis, Tennessee, was in violation of the White Slave Traffic Act, and prosecution has been authorized therefor by the United States Attorney at San Antonio.

The investigation has also disclosed that on April 5, 1933, Hetherington, under the name of Arthur Adolph DeBussey DeBougainville Charles Vincent Maurice Pierrepont, married a young woman at Houston, Texas. At this time Hetherington was conducting religious meetings at the Full Gospel Mission. He claimed to be a Frenchman, to have been born in Paris, France, of noble parentage, and to have served in the French Army as a Colonel during the War. In the latter part of May 1933 he traveled with his bride to Westlake, Louisiana, as a preacher of the Assembly of God Church. While there he obtained sums of money from various parishioners for the express purpose of proceeding to Mexico, where he was to sell a large tract of land owned by him, the proceeds to be used to build an Assembly of God Church at Westlake. He returned to Houston, and on June 27, 1933 after borrowing a minister's car for the purpose of visiting an official of the French Government then in Houston, he disappeared. The car was later found in Shreveport, Louisiana and Hetherington is presently wanted by the Houston police for its theft.

The United States Attorney at Houston has indicated his willingness to prosecute Hetherington for violation of the White Slave Traffic Act in having transported his bride from Houston, Texas to Westlake, Louisiana and return.

Hetherington, under his various aliases, is believed to have married, swindled and deserted numerous unsophisticated women throughout the country, using the approach and methods indicated above. He is last known to have been in Birmingham, Alabama in November, 1934, although he was tentatively identified at Los Angeles, California early in June, 1935 at which time he was believed to be driving a new tan coupe, make unknown.

The following is a composite description summarizing the information furnished by the various persons whom Hetherington has defrauded:

Age	45 to 48 years
Height	5' 2½"
Weight	160 pounds
Build	short legs, thick body
Hair	black; receding, high forehead
Eyes	hazel
Complexion	olive
Mustache or Beard	generally clean shaven, although has heavy beard necessitating frequent shaving; sometimes wears small mustache or Van Dyke beard.

Teeth	one upper tooth discolored
Eye-glasses	none
Scars and Marks	small indentation on forehead; hair line scar on chin; small scar on one upper forearm; believed to have round scar on abdomen, allegedly bullet wound received during War.
Marital Status	married
Race	white
Occupation	itinerant Evangelist; reported also to be a licensed physician and also to have been a member of the staff of the French Embassy in Mexico.
Nationality	probably English or Canadian, as has a pronounced English accent; claims to be English or French.
Speech	eloquent speaker with excellent command of the English language; can sway an audience with humor or pathos; also speaks and writes French and some Spanish; claims to speak fourteen languages.
Education	apparently well educated; has some knowledge of medical terms and claims to be a graduate of Oxford and to have a medical degree from the Royal Surgery College in England; appears to have traveled widely and claims to have been a Medical Missionary at Johannesburg and East London, British South Africa and to have traveled in India and South America. The advertisements of his revivals refer to him as "of London and Paris, World-Wide Traveler, Missionary and Evangelist", and state that he "will tell of his experiences with Foreign Legion, cannibals, China, Africa, etc."
Dress	dresses neatly; wears number five shoe; claims feet small because arches broken by clubs when preaching the Gospel in Africa; has fallen arches which give him trouble.
Peculiarities	subject to colds and bronchial trouble; smokes cigarettes only occasionally; said not to drink intoxicants, although claims enjoys a glass of beer; legs are bowed just above ankles; is excellent mimic; may attempt to go on the stage; said to know something of jiu-jitsu and claims to have wrestled some; claims to have learned to fly when in the French Army and to have subsequently owned his own plane; is very popular with women; refers to children as "tots"; is boastful of his family, allegedly of the English or French nobility and of his education; knowledge of medicine, and accomplishments as an Evangelist; claims to be minister of the Pentecostal or Four Square Gospel Church and to have preached at the Crystal Palace, London, and in the Angelus Temple, Los Angeles.

Criminal Record

no fingerprints or criminal record of this individual have been located.

Law enforcement officials and agencies are requested to transmit any additional information which they may have regarding this individual to the office of the Federal Bureau of Investigation, United States Department of Justice, covering their respective districts and in the event he is apprehended, kindly hold him for the Federal Government and notify the nearest Bureau Office.

* * * * *

CLUES IN CLOTHING

There are few articles that afford so many clues to the personality, habits, and history of the owner, as clothes. Few articles better repay careful examination, which is in the main chemical and therefore work for a Criminological Laboratory.

Clothes may be considered under various aspects, for example in relation to the nature of the material of which they are made, their age and the state of repair and the stains, marks, dust and dirt that may be found upon them; but there are other features, too numerous to specify, to be taken into account. Each case should be considered as a separate and special study.

* * * * *

FINGERPRINT SAFEGUARDS

The Sheriff's Office at San Diego, California, recently submitted to the Bureau the fingerprints of 80 persons who were applicants for positions as Special Deputies. Six of the applicants, or 7.5%, were found to have criminal records in the Bureau's files. One of these persons had received a sentence of six months after conviction of violation of Section 141a of the California Vehicle Act. Another had been convicted of violation of the Wright Act, and a \$100.00 fine imposed. The other applicants had been arrested for such offenses as failure to provide, driving while drunk, violation of the National Prohibition Law, and grand theft.

COLLECTION OF SPECIMENS

In the collection of specimens to be transmitted to some other point for laboratory examination, there are two considerations desirable to bear in mind. From a legal standpoint, the prosecution, in order to be able to use a specimen as evidence, must be prepared to show the complete chain of its custody and to identify it with the place in which it was located or with the crime in an irrefutable manner. At the same time the detailed examination is of no value unless the specimen is maintained in such a condition that the introduction of new elements does not change its characteristics between the time of the collection and the examination. This last requirement is a practical matter which, however, has legal aspects in that the prosecution must show by competent evidence that the characteristics observed in the detailed examination are those existing at the time of the crime.

Of these requirements, the first, that of custody, is facilitated through the use of proper seals on the receptacles containing objects which may be marked, and through the marking of the object itself, where this is possible. Bullets, cartridges, weapons of all kinds, indeed any object on which this may be done, should be appropriately marked by the person finding them. This marking is not, however, sufficient of itself, as it is further incumbent upon this person to give a complete description of the location of the specimen, the condition in which it existed, and its relation to other objects. The conventional "X" scratched or marked on objects for the purpose of identification is to be discouraged since it is seldom distinctive enough to enable an individual to impress the court or jury that he is positively certain that he made the "X" in question; the use of the initial letter of the investigators name is better. There is one danger in permitting a specimen to be initialed and that is that it may lead to abuse where certain experts have developed a means of marking that practically forces the prosecuting agency to call them for testimony. The name or initials of an expert, not called to testify, appearing on an object may lead to unnecessary explanations. The resourceful investigator will develop his own simple and effective method of marking for identification and will record the symbol, and location on the evidence, when he makes up his personal memorandum.

In marking the specimen care must be taken to insure the fact that the mark does not interfere with the later examination. Bullets, for instance, must be marked on the base - never on the side because it is the side which is to be examined in detail. Conversely, cartridge cases should be marked on the side or on the interior and never on the base because it is the base which is to be examined. The marks placed upon weapons should not interfere with the examination of stains, discolorations or previous marks.

Movable objects of all kinds which are to be examined should be removed bodily, and so far as possible placed in appropriate wrappings so that they will be preserved in their existing condition. This means that the wrappings must be clean and of a character which will preserve the objects from wet, heat, or other forces which they may encounter.

Liquids, stains, and similar substances, which are to be examined at another point should, if at all possible, be removed by a laboratory expert, for the reason that he knows best in each individual case how to handle the

specimen so as to protect it. Dried fluids present difficulties because soaked into surfaces on which found. Nevertheless; when it is impossible to obtain an expert, the investigator must remove and preserve these specimens. As each individual case presents a different aspect, he should remember the general rule to so preserve a specimen that it remains in the condition in which it is found. If the specimen is imbedded in wood, plaster, soil, or other material of a porous nature, a sufficient piece of this material should be taken around the specimen in order to collect all of the specimen which may be present even though to do so results in defacing some of the object.

If fluids and similar substances are so located that they may not be collected by removing a portion of the object, then they alone are removed. If the fluid is not completely dry, a chemically clean piece of blotting paper may be used to absorb it. The blotting paper after absorbing as much of the fluid as possible is placed in a suitable receptacle and labelled as if it were a part of the object on which the stain was found. If the stain is of sufficient quantity and is only semi-fluid, it may be gathered directly into chemically sterile containers. Glass containers and glass utensils for removing such substances are preferable to others. If they are not available, then enamelware or silver may be used.

If the stain is dried, it may be removed by loosening with a clean knife and scraping or brushing the particles into a receptacle. A perfectly clean brush should be used to perform each operation. If the stain cannot be scraped up a solvent is used, the stain dissolved and the solution collected. Distilled water or physiological salt solution (.85% sodium chloride in distilled water) are the only solvents used by an investigator when he attempts this method. Even though the substance may be composed of organic matter which would spoil, no preservative or other material may be added to the specimen. If it is likely to spoil, it may be kept cold.

When searching for stains on clothing, the linings of the pockets should be examined. Similarly, fingernails, the crevices of boots, and the joints of weapons often yield stains even though the main portion of the object has been thoroughly cleaned. Cleaning many times results in washing the stains into crevices. Even though stains have been thoroughly washed from clothes or other similar objects, or, though the materials have been burned, they should be preserved and further examined, because it is possible to get positive results from tests notwithstanding these conditions.

If the object on which the stain exists is damp, it must be dried before being packed, to prevent mold. Artificial heat should not be used for such drying. If the stain is on plaster or similar material which would crumble, the crumbling should be prevented by imbedding the object in plastiscine or a similar substance, taking care that the stain does not come in contact with the clay.

If specimens of evidence are collected and transmitted to the criminological laboratory with the precautions heretofore set out, the law enforcement officer may be assured that the admissibility of the evidence collected by him will not be attacked upon the basis of improper handling.

DACTYLOSCOPIC IDENTIFICATION OF CADAVERS

By Dr. Israel Castellanos
Director of the Bureau of Identification of Cuba

When a person is detained, on suspicion or accusation, thought is always given to the obtaining of his fingerprints. The police are always pre-occupied in knowing his past, in discovering whether he is a fugitive or a known malefactor. When a cadaver is floating on the waters of a river or found on the side of the roadway, with or without visible lesions, not so much thought is given to the fingerprints. And much less is the application of this method thought of, when a person is found in the state of coma, unconscious or dying in a hospital in which he dies hours afterwards, without uttering a single word. Before death it appears that the desire is lost or the social duty forgotten of knowing exactly who the deceased is.

In the United States, according to Elliot Thurston, there are interred every year about 60,000 cadavers without identification. The greater part of these persons, who lacked penal antecedents, were buried without giving any data which would aid scientifically in identifying them. If some of them were insured, their families, through not being able to verify the demise could not make the corresponding policy effective. And through years of uncertainty and increasing misery, they expect the loved one who never returns.

In the greater portion of the countries, in morgues and funeral homes, unknown cadavers are exposed for a period of 24 hours, as a means of facilitating their recognizance and identification. When the cadaver is not identified during the fixed period, it is taken to a common burial ground. There is a grave without a name and one more mystery.

Who was the deceased? This question, on an average, in the United States alone, is asked 5,000 times each month.

It is necessary that we preoccupy ourselves as much in the identification of unknown cadavers as of the accused and wrong-doers. Social prevention should be as effective in the mystery of death as in the mystery of a crime.

Society, as a family, should be the mistress of truth and should encourage the avoidance of every danger to one of its members.

In our day we prepare an inexpensive method, simple and infallible, to identify the man from birth till death, that is to say, from the cradle to the sepulchre. If in any period of his life he is left unidentified and brought to a hospital, to an asylum, to a prison or to a morgue as unknown, it is because society, lacking foresight and unwise, has not fixed scientifically the personality of the subject, through his perpetual and immutable anatomical name, substituting it for the unsteady and useless social formalities.

Dactyloscopy is not a system exclusively for criminal use; it is a system applicable to every phase of civil life; it is, as Reyna Almandos says, a force aiding individual liberty which not only enhances the human personality but also protects it from the error of a false identification. It is, in addition, a proceeding by which every grave can boast a name, since every man, living or dead, has on the fingers of his hands, his own. If this situation does not obtain, it is because society does not bother to take it up.

The natural name, anatomical or anthropological, as some authors refer to the fingerprints, is easy to take in a living subject. In a cadaver it is necessary to know some technique in order to do it correctly.

When there have elapsed only a few hours since death and the cadaver is perfectly preserved, the identification expert can proceed to take the fingerprints as though the subject were living; but, on the contrary, when the cadaver is in a more or less advanced state of putrefaction, special technique is required, the degree employed according to the case. In every circumstance the operator should ask these questions:

How can rigor mortis be overcome?

How should the finger tips be prepared in order to obtain a good impression?

How should the fingerprints be taken?

The ease with which, after a few minutes practice, there can be obtained fingerprints from a living individual depends on the extraordinary movability of the terminal segment of the arm of a man. To accomplish this four or seven hours after death, the rigidity of the cadaver, the wrist and the joint of the fingers lack flexibility, resisting the freedom of movement and obliging the expert to change the current technique for taking fingerprints of living persons.

In effect, the cadaveric rigidity, which disappears when putrefaction becomes general, opposes the correct impression of the digital pulp and the obtaining of rolled impressions. The lack of movability in the joint of the wrist and in that of the fingers is what hinders the habitual operations of the identification officer. His first step, then, should be to overcome the rigidity of the hand and of the fingers, in order that he may be able to operate freely and rapidly.

When death is recent or the cadaver is perfectly preserved, after washing and carefully straightening the fingers we should firstly perform a series of rough and violent extensions and flexions of the joint of the wrist, afterwards of the metacarpal phalanges, and lastly, of each one of the joints of the fingers, commencing with the thumb of each hand.

Xavier da Silva, of Lisbon, who systematically practices dactyloscopy on cadavers, recommends submerging the hand and a third of the lower part of the forearm in well heated water, for a duration of a minute or less, and, after straightening the highest extremity of the fingers, repeating the

intense, rapid and continuous movements, from the wrist to the fingers. The procedure of the Portuguese maestro is excellent in firm and well preserved cadavers.

But there are cases in which flexibility of the fingers cannot be obtained, nor movability of the wrist, by which it is necessary in such cases, to resort to another technique which permits the expert to correctly perform his work. Stockis, of Liege, suggests in such cases, the cutting of the flexure tendons of the fingers or the severance of the wrist. This last operation which separates the jointed surfaces of the wrist, can be executed only by a surgeon, because, in reality, it is a surgical operation. For this reason, it is not recommended.

The cutting of the flexure tendons in the fingers, although it actually constitutes a tenotomy, since it is an operation to sever determined tendons, is the most simple, and can be accomplished in a cadaver by a layman, provided that he has previously seen the incision or the cutting of the line of the wrist.

The cutting of the flexure tendons of the fingers which can be done perfectly with a knife, gives the greatest flexibility to the fingers and allows the expert to obtain the fingerprints in the most rapid, convenient and safe manner.

When there is a doctor, he, by means of a tenotomy or cutting the flexure tendons of the fingers, endeavors to overcome the cadaveric rigidity in order to obtain good fingerprints, utilizing a narrow knife, making a small incision and cutting the tendons below the skin, in which case there remains only a wound or a very small incision.

Once the cadaveric rigidity is conquered, the expert then prepares the tip of the finger to obtain a good impression of them.

If the death is recent, and the cadaver well preserved, it is sufficient to massage the pulp before inking to procure a perfect impression. But, on the contrary, if the body is in a more or less advanced state of putrefaction or mortification, softened or decomposed by water, the tip is wrinkled or furrowed by folds more or less exaggerated, impeding the obtaining of good fingerprints. In these cases there is done what De Rechter, of Brussels, calls the "plastic regeneration of the digital extremities".

The complete elimination of the furrows or wrinkles of the digital bulbs is accomplished with extreme ease. The special technique for the plastic restoration of the finger is based on the introduction of an adequate substance into the body of the tip. Rechter, using a Pravaz syringe, has injected without distinction in the bulb, liquid vaseline, hot water, glycerine, melted paraffin and glycerine water. Stockis asserts that he has tried all these liquids with different results, so he recommends the injection of glycerinated gelatin. By this method one part of a hot solution of gelatin is added to seven parts of glycerine, and heating the mixture still further, it is injected into the fingers of the cadaver. The elimination of depressions and the plasticity acquired by the tip of the finger facilitates the obtaining of excellent fingerprints.

The injection of the mentioned substances into the body of the fingers, cannot be effected with very thin water, because at times this liquid will flow out more or less slowly through the perforation made by the needle. If the liquid is very thin, as water, it is more liable to drain away; if it is very dense, as paraffin, the corpula should be more rounded and the opening in the skin much larger. But in 1912, Xavier da Silva, of Lisbon, made a definite solution to the problem, in a manner very rapid, simple, and economic, recommending the injection of air through a very fine needle. Air, which has afforded the best results, can be injected into the finger itself without any danger.

Xavier da Silva employs a Pravaz syringe of a capacity of 5 c.c. The charge of air forces the embolus to recede. In the finger of the cadaver the needle penetrates until it reaches the dermis or the outer covering of the skin, which is easy to recognize by the fact that the least resistance is offered to the penetration. The point of selection to inject the needle is the extremity of the longitudinal axis of each finger, some 4 or 5 mm. in front of the open edge of the fingernail.

The quantity of air to inject for the plastic restoration of each finger tip as a means of obtaining a good impression, without wrinkles or furrows, fluctuates between 1 and $1\frac{1}{2}$ c.c.

When it is noted that the digital bulb is conveniently inflated, the needle is extracted rapidly and in a continuous operation a light massage is begun over the hole produced by it, in order to close the perforation and avoid the egress of the air injected into the finger tip.

When the fingers have become flexible and movable and the depressions, wrinkles and furrows eliminated from the digital bulb, the procedure is to ink the fingers and print them in the usual manner.

The difficulty of obtaining good fingerprints from cadavers has been the object of study by the experts, who conceived special implements and holders.

Mr. M. J. Wigman of Green Bay, Wisconsin has contributed to the subject a small inking plate and a support to obtain fingerprints of cadavers. J. F. Steegers, of Havana, conceived a support, small and easily handled, which has found splendid application in morgues and hospitals. Xavier da Silva, of Lisbon employs a special support and finger holder exclusively for cadavers. H. Soderman, of Stockholm, utilizes a small wooden groove for this type of work. R. Heindel, of Berlin, points out that an expert of Stuttgart has constructed a special holder, which facilitates rolling the impression of the finger. Some of this special equipment can be purchased in certain commercial houses. The expert, then, has different apparatus and instruments which are offered for his consideration.

But, everything which has been expounded, refers only to ordinary cadavers, that is, common corpses, which are fingerprinted a few hours after demise, in a good state of preservation or with putrefaction scarcely begun. In cadavers of an advanced state of decomposition, in those burned and in

those drowned, according to the length of immersion, the methods vary in each circumstance.

In drowned bodies, the skin of which has begun to rot away, Soderman recommends carefully cutting the skin of the palmar surface to a sufficient length in order that all the elements of classification may be collected. The fragments of skin are placed in bottles in a solution of formaldehyde, using a bottle for the skin of each finger. Each bottle is labeled and all are placed in a small wooden box.

In Argentina, when all the papillary ridges of the outer surface are noted, the operator, who has covered his right hand with a rubber glove, places it on the respective fingers of the cadaver, the third phalange of which has been amputated, by which he can place the skin over the glove with a finger stall. When, instead of a sheath, only a fragment of the skin is prepared, the expert places it over his index finger and proceeds as though he were obtaining his own rolled impression. This is the procedure current among European experts.

When the papillary ridges have disappeared from the outer surface, the fragment of skin is carefully mounted on cardboard, with the internal surface turned towards the outside, in order to obtain the photograph. Stockis, the maestro of Liege, was the first to point out that when the inner surface of the epidermic pellicle is examined, a papillary design admirably preserved is seen, which is a negative reproduction, such as a mold of the finger design of the other surface. The ridges of the cutaneous surface are here represented by the furrows of the pattern of the inner surface and inversely; a bifurcation of the ridges on the surface of the epidermis will correspond, on the dermic surface to the extremity of a ridge which is traversed by a bifurcation of furrows.

Reuter has noted the presence of this papillary relief on the inner surface of the cutaneous pellicle in numerous drowned cadavers: but he does not try to place it in evidence in all those cases in which the surface of the epidermis is damaged, muddled or deteriorated. The idea, therefore, is due to Stockis, that when the skin, on applying the ink, only shows a blot without details, the inner surface of the epidermis, adequately photographed portrays a clear and perfectly papillary design, which permits safe and correct identification.

The importance of the plastic regeneration of the digital extremities, as some put it, or the plastic restoration of the fingers, as others say, extends the period of the utility of fingerprints as a medium of identification. De Recher, of Brussels, has been able to identify the victim of a crime, after having them interred six weeks.

It has been shown, therefore, that with the systematic employment of fingerprints, there can be avoided safely nameless graves.

Mr. M. F. Nuremberg, of Los Angeles, California, can identify through the medium of fingerprints a man almost carbonized.

The papillary design of the fingers, under the most unfavorable conditions, in different atmospheres, from exposure to the light of the sun to concealment in the shadows, from the clarity of the plains to the obscurity of the sepulchre, from soaking with water to consuming fire, appear to resist all this; it is to be hoped that they can be assembled on a sheet of paper in order to certify by it the anatomical name of the deceased. It is hoped that fingerprints will become what they actually are: an element of peace and social security.

The exposition of cadavers in morgues and funeral homes, as well as the photographing of unknown cadavers, satisfies neither the layman nor the technician since one as well as the other knows that an altered countenance renders identification difficult and is conducive to error. Heindl of Berlin, wisely maintains that fingerprinting an unknown cadaver should never be neglected.

Under the direction of Police in Dresden, there was established recently a "Central Office of Corpses and Missing Persons" which primarily was limited to Saxony, but which later extended its activity to all German territory. Another analogous office has been created in Berlin. It is not known if there exist in other sections similar offices.

The Police Prefecture of Paris, when it has a cadaver, the identity of which has not been established, begins by distributing illustrated circulars with the description and the photograph of the largest part of the personal articles of the deceased. The similarity of most of such documents as well as the increasing effectiveness of dactyloscopy, has motivated a special circular of the Ministry of Justice, in which there is entered concerning each unknown cadaver: 1st. The fingerprints taken as clearly as possible; 2nd. the anthropometrical measurements; 3rd. the photograph of the front view and profile, 4th. the description of the particular marks (cicatrices, tattoos, etc.). All this should be done at the time of discovery and always before the autopsy.

In the morgues of Lisbon, Rio de Janeiro, etc. the fingerprints of unknown cadavers have been taken for many years. In the Necrocomio of Havana, dactyloscopy has been used in such cases for more than ten years.

Nevertheless, it is necessary to do more, it is important that we strive in order that all unknown cadavers may be identified correctly, whatever their state of preservation may be or how natural are the circumstances surrounding the demise. The fingerprint cards prepared will have multiple and important applications. They will serve to formulate international statistics on cadavers buried without identification, the number of which can be reduced to nothing by the universal use of dactyloscopy; they will serve as verification any time, and lastly, they will serve in many cases to identify numerous citizens who die away from their family and far from their native soil. Fingerprints are never odious. Only the man who ignores the morphological treasury which his fathers have placed in his fingers, abhors and detests them. He who knows that in his fingers is exhibited his true and inconfusable name, defends, embraces, and seeks them. This is the name that we should register from birth till death, since the appillary ridges always tell whom is whom in the world of men.

The foregoing article has been translated from the Spanish and is being reproduced in the FBI Law Enforcement Bulletin by the kind consent of Dr. Israel Castellanos.

* * * * *

ELIMINATION OF SUSPECTS

Following the location of any latent fingerprints at the scene of a crime, the prints of all persons whose occupancy of the place under inspection has been for legitimate purposes may usually be excluded from further inquiry. It is advisable, therefore, during the initial stages of the investigation where latent fingerprints are found to exist, to secure the prints of all members of the household, the servants, and any other person who may have come into contact with the object. This, of course, must be done to find "strange" prints or prints of an individual who has not frequented the room theretofore. It is sometimes necessary to take into consideration the appearance of the prints when they are first discovered; i. e., whether they are clear or a slight film of dust appears over them. This is important as a suspect may enter the defense that he was in the room legally at some time before the actual commission of the crime and may have touched the object under discussion then.

CLYDE MACK

ESCAPED PRISONER FROM NORTH CAROLINA ARRESTED UNDER AN ASSUMED NAME
IN ARIZONA, ON CHARGE OF DRUNKENNESS, IDENTIFIED AND APPREHENSION
SECURED THROUGH FINGERPRINTS FORWARDED TO BUREAU

The Superintendent of the State Bureau of Identification at Raleigh, North Carolina, notified the Federal Bureau of Investigation in July, 1935, that one Clyde Mack was wanted for escape. Mack had been received at the North Carolina State Prison in March, 1933, to serve a term of six years for larceny and breaking and entering. He escaped from that institution on June 12, 1935. Being advised of his escape, the Bureau placed a wanted notice against his fingerprint record in the identification files.

A fingerprint card was received in the Bureau on August 5, 1935, from the Police Department, Prescott, Arizona, reporting the arrest of one Claude Haygood by that Department on July 29, 1935, on a charge of drunkenness. These fingerprints were checked through the files of the Bureau's Identification Division and it was found that Claude Haygood was identical with Clyde Mack, the fugitive from North Carolina. A telegram was dispatched at once to the authorities in North Carolina advising of the fugitive's arrest at Prescott, Arizona. The Police Department at Prescott was notified that this subject was wanted as an escape from the North Carolina State Prison. Upon the receipt of this report, the fugitive was turned over to the Sheriff's Office at Prescott to be held for the North Carolina authorities. On August 7, 1935, a State Officer from North Carolina departed for Prescott to take the fugitive into custody and return him to the North Carolina State Prison.

This case is but one of more than 460 cases occurring during August, 1935, in which the Bureau's fingerprint records were instrumental in identifying fugitives who were arrested outside the jurisdiction seeking their apprehension, and on charges having no relation to their fugitive status. It is interesting to note in this case that although the subject was arrested under an assumed name, on a minor charge, and in a state far distant from the scene of his escape, his identification as a fugitive and his apprehension as such were secured through the Bureau's fingerprint records. It appears rather obvious that the most effective method of determining a subject's complete criminal record and ascertaining whether or not a subject may be wanted is through constant adherence to the policy of forwarding fingerprints of all persons who are arrested to be checked through the central clearing house of fingerprint data maintained by the Bureau.

ARTHUR KRELLER

APPLICANT FOR TAXI DRIVER'S PERMIT IDENTIFIED AS FUGITIVE
THROUGH FINGERPRINTS FORWARDED TO BUREAU

The Federal Bureau of Investigation was requested by the Prosecuting Attorney at Lisbon, Ohio, in August, 1933, to place a wanted notice in its fingerprint files for one Arthur Kreller, whose apprehension was sought on charges of auto theft. Kreller had been indicted for stealing an automobile in Columbiana, Ohio, on April 15, 1933, and all efforts to secure his apprehension had been unsuccessful. Accordingly, a notice of this person's fugitive status was placed in the Bureau's Identification Division.

The fingerprints of one Arthur Pieper were received in the Bureau on August 12, 1935, from the Police Department at Cleveland, Ohio. The fingerprint card indicated that Pieper made application for a taxi driver's permit on August 9, 1935, and that the fingerprints had been taken in connection with this application. These fingerprints were searched through the files of the Bureau's Identification Division and it was found that Arthur Pieper was identical with Arthur Kreller, the individual wanted by the Prosecuting Attorney at Lisbon, Ohio. Accordingly, that official was notified by telegram that the fugitive's fingerprints had been received from the Police Department at Cleveland, Ohio, as a taxi permit applicant. Moreover, the Chief of Police at Cleveland was advised of the applicant's fugitive status. Shortly after this information was received from the Bureau, Kreller was taken into custody by the Police Department at Cleveland, Ohio. He was turned over to the Sheriff of Lisbon, and brought to that city for trial.

It is noted in this case that although the fugitive had applied for a taxi driver's permit under an assumed name, his identity as the subject wanted at Lisbon, Ohio, was determined definitely by means of fingerprints. Furthermore, the Bureau's files disclosed that he had been received at the United States Industrial Reformatory, Chillicothe, in June, 1931, to serve a term of two years for violation of the National Motor Vehicle Theft Act.

Law enforcement agencies in many cities are taking advantage of the Bureau's invitation to forward fingerprints of applicants for taxi driver's permits and for various types of positions to the Bureau so that each applicant's complete criminal record may be known. Indicative of the effective results that are being attained through this practice, it is observed that the fingerprints of 65 applicants for chauffeurs' licenses were received in the Bureau during August, 1935, from the Police Department of a mid-western city, and criminal records were disclosed in 29 cases. Ten of these persons had served penitentiary sentences after conviction of such offenses as counterfeiting, forgery, larceny, burglary, violation of the National Motor Vehicle Theft Act, highway robbery, white slavery and embezzlement. Four of the applicants had served two terms each in the penitentiary.

The value of submitting fingerprints of applicants is well expressed by the Chief of Police in one city who stated that "this practice has been followed with amazing results, which has been found to be of incalculable aid in ridding the city of undesirables and denying persons with criminal records employment in institutions where their employment would be a danger."

OFFENSES KNOWN TO THE POLICE
JULY AND AUGUST, 1935.

Under the system of uniform crime reporting, as adopted by the International Association of Chiefs of Police, monthly reports of known offenses are forwarded to the Federal Bureau of Investigation, and tabulations based thereon are included in the quarterly publication entitled "Uniform Crime Reports". However, in order to make national data available at the earliest possible date, a compilation based on the reports of the larger cities for July and August is presented below.

The table shows the total number of offenses reported based on reports received from the police departments of 73 cities with an aggregate population of 23,559,978. The figures are also presented in the form of daily averages.

It will be noted that there is no substantial change in the number of offenses reported for each of the two months. The compilation shows slight decreases in offenses of murder, negligent man slaughter, and burglary, with increases in the number of offenses of rape, robbery, aggravated assault, larceny, and auto theft.

Daily average, offenses known to the police, 73 cities over
100,000, July and August 1935
(Total population, 23,559,978, as estimated
July 1, 1933, by the Bureau of the Census)

	Murder, nonneg- ligent man- slaugh- ter	Man- slaugh- ter by negli- gence	Rape	Rob- bery	Aggra- vated as- sault	Bur- glary- break- ing or enter- ing	Larceny- theft	Auto theft
--	--	--	------	--------------	---------------------------------	---	-------------------	---------------

Number of
offenses known:

July	176	74	167	1,596	1,206	7,027	15,840*	4,757
August	161	69	175	1,753	1,323	6,989	16,128	4,940

Daily
average:

July	5.7	2.4	5.4	51.5	38.9	226.7	511.0*	153.5

The following letter together with the latent fingerprint shown below, has been received in the Federal Bureau of Investigation from Mr. Charles A. Wheeler, Chief of Police of Bridgeport, Connecticut, and is being reproduced for the information of law enforcement officers.

This fingerprint is reproduced below (A) together with a drawing (B) to approximate scale of the latent print in which the important ridge detail has been emphasized by retouching.

A**B**

"J. Edgar Hoover, Director,
Federal Bureau of Investigation,
Washington, D.C.

Dear Sir:

"September 30th, at 12:20 A.M. two of our Police Officers were shot and killed by a burglar whose identity is unknown. About six minutes previous a complaint was received at our headquarters that two men had broken the window of a Music Shop and were in the store committing a burglary. The complaint was put out on our police radio and the two officers responded to learn that the men had left the scene of the crime and escaped in opposite directions. Another police car responded at the same time, and each car made search in the opposite directions as taken by the burglars. One car bearing a uniformed sergeant and patrolman came upon a man carrying a small radio under his arm. As the officers jumped from the car to within a few feet of this man each were fired upon almost simultaneously without an opportunity of drawing their revolvers, and one died within an hour and the second followed in death the next day. The murderer escaped, but he had dropped the radio that he had carried. The other burglar, his accomplice, who left the scene of the crime as above stated in an opposite direction escaped the detection of the car that searched in the direction he had taken, and the small radio that he had taken is still missing.

"We have been furnished a description of both, as follows:

#1. White, 25 to 30 years of age; 5'7 or 8, stocky; broad shoulders; short neck; heavy eyebrows; and he wore a dark suit, colored shirt, a light necktie much in contrast with the shirt; light gray soft hat with a snap brim. This is the man who escaped with the radio unrecovered.

"#2. (MAN WHO KILLED OUR OFFICERS) He is described only as slightly taller than No. 1; much 'thinner'. He wore a dark suit and a light gray soft hat.

"The radio stolen by No. 1 man, and still missing, is an AIR KING, 5 tube, table model; color brown with a lighter color on edge; about 6 x 8 inches, button on rear for short wave reception; two illuminated dials; Serial No. 12901 or 12902 is written in ink on a paper label that is pasted on the inside of the cabinet.

"An investigation at the scene of the burglary revealed that these two men had been in the doorway of the Music Shop for some few minutes. They attempted to force the front door but apparently could not. One of the men (No. 2) used the butt of a revolver to smash the large side plate glass in the front vestibule of the store entrance, making an opening sufficiently large enough for each to reach in and each to take a radio from the window. The smash was heard by nearby parties who made the report, and by the time the police cars had arrived the burglars had left. It was at this point that the witnesses informed the officers the various directions taken. A search at the Music Shop made subsequent to the shooting failed to reveal any physical evidence other than a pair of revolver grips, one of which was broken, and they were from a U. S. 32 revolver. The grips were evidently broken when the revolver was used in smashing the window, and we believe this is the gun used in the shooting of our policemen. Each policeman was felled with only one bullet, and both lethal bullets are of 32 calibre. They are now in the hands of our ballistic experts who are conducting an investigation in this direction.

"The radio dropped by the killer was recovered by a detective sergeant within five minutes after the shooting, and our investigation has conclusively proved that the only hands that touched this radio from the time it was received by the Music Shop from the manufacturer was the proprietor, the burglar, the detective sergeant, and our identification officer. The radio was examined at one o'clock that morning for latent fingerprints, and we were successful in developing at least one print the condition of which we believe is worthy of consideration for the purpose of identification. This fingerprint, including all finger marks, were immediately photographed and both contact and enlarged prints were made. A deduction was made by our officer that the print which we know to be the best, was left by the impression of the LEFT RING FINGER of the murderer. The finger impressions had been drawn, but this finger in particular came better 'at rest' than those adjacent. We classify it as an ulnar loop pattern, with converging ridges about the core, with 15 or more ridges

from delta to core. For the purpose of collaboration, our officers consulted experts outside of our own department to secure an INDEPENDENT CONCLUSION and the conclusion furnished is decidedly that of our own---that is to the finger, the pattern, and approximate ridge count.

"These prints we believe are positively from the fingers of the man who killed our police officers. They were compared with the prints of the proprietor and the detective and in no way were similar. The proprietor informs us that about three or four days before the crime he had gone into the large window and dusted all articles including this particular radio, and he stated that this was his general practice as it was necessary in the handling of musical instruments that they be kept in presentable condition for sale. Our investigation into the latent print angle can lead us to no other conclusion but that the prints found were those left by the killer.

"We are enclosing contact prints ear-marked A, B, and C. 'A' is a photograph of the one we believe to be from the left ring finger, and the one most worthy of study. 'B' is apparently from the left index, while 'C' shows three from the right hand, deductively the right middle-ring and little. In the case of 'A' which print, like those along side of it, was drawn and the white horizontal line across the top marks the division so that all below it constitutes the LEFT RING FINGER PATTERN. Two officers in one day's time, in our file of approximately 10,000 prints, examined all left ring fingers in ALL NUMERATORS over ALL ODD NUMBERED DENOMINATORS, and a search fails to reveal an identical print. All females, all colored persons, all individuals over 35 years of age were readily eliminated leaving the search confined to those from 16 to 35 years of age, white in color, and in this respect only a small percentage had a similar type ulnar loop about this ridge count. In the search, due to the lack of much detail in the print, much consideration must be given to the personal characteristic of the individual the comparison is being made with. We agree the ridge characteristics in the print are few--but the search would be a worthy one. Will you cooperate with us in an attempt to identify the killer of two of our best-loved policemen?

"We would appreciate a search of your files, and when your search is concluded I would most certainly appreciate a report of your findings or suspicions whether or not there are any within this category whom you might be dubious of, for in this respect our identification officer and this Department have been assured of the consultation, and the assistance of one of the best fingerprint experts on latents in this country.

"This crime has caused great concern to every policeman in this Department; to the bereaved families of these brave officers, and to every public minded citizen here and elsewhere interested in 'The Policeman', and rewards already totalling \$2,000 are now

being offered for information leading to the arrest and conviction of this killer of policemen.

"Thanking you most kindly for the courtesy of your cooperation, for your reply of your findings, and for any suggestions or information that you may extend to us, and assuring you of our willingness to supply you with any further details or information that you may desire and that we may have which might assist you in such cooperation as we beseechingly ask, I am,"

Very truly yours,

Chas. A. Wheeler
